1 Purpose & Scope

Qorvo is committed to reducing the impact of known toxic substances in our products and processes. This starts with reducing or eliminating chemicals and substances that have been identified as hazardous to air, water, soil or human health in our processes and products – from the starting materials through to assembly and shipping materials. The purpose of this document is to inform Qorvo suppliers about the requirements for testing their materials to ensure these substances are not contained.

This document applies to those suppliers whose chemicals, materials, and/or components are used to manufacture Qorvo products. These suppliers provide chemicals, materials, and/or components to Qorvo Sub-Contract Assemblers (SCAs) or to Qorvo facilities, who then manufacture the Qorvo product.

These materials are platings, components, or assembly materials that become incorporated into Qorvo’s final product. These requirements apply to materials to be used in engineering trials also.

If a supplier has any questions regarding this specification, please contact the Qorvo Product Compliance Team at QorvoGreen@Qorvo.com for advice.

2 Definitions & Acronyms

Please see LIS-000602 for definitions related to this specification.

3 Roles & Responsibilities

<table>
<thead>
<tr>
<th>Role</th>
<th>Responsibilities</th>
</tr>
</thead>
</table>
| Qorvo Green Group (QGG)                   | 1. Monitor worldwide regulations and standards to determine the potential impact on Qorvo products  
                                          | 2. Monitor Significant Customer requirements to determine the potential impact on Qorvo products  
                                          | 3. Use the information gathered from Steps 1 and 2 above to revise and update this specification.  
                                          | NOTE: All related Assembly Subcontractor and Supplier data shall be forwarded to the Qorvo Green Group at QorvoGreen@Qorvo.com |
| Qorvo Assembly Subcontractor (Sub-con) and Suppliers: | 1. Comply with sections 5 and 6 of this document.  
                                          | If the material composition of a component or material is changed, the Supplier shall send Qorvo updated 3rd party analytical testing per the requirements in Sections 5 and 6 below. |

5 Compliance Requirements

5.1 3rd Party Lab Test Reports

5.1.1 Suppliers whose products will be used to manufacture Qorvo wafers

5.1.1.1 3rd Party Lab Reports are not required.

5.1.2 Suppliers whose products will be used to assemble Qorvo products

5.1.2.1 Suppliers providing components and materials used in Qorvo products must also provide independent lab test reports at the homogeneous material level for substances listed in Table 1. This applies to all components and materials (i.e. platings, solder pastes, capacitors, inductors, couplers, resistors, substrates, die attaches, mold compounds, bond wires, under-bump metallization, lead frames, etc.).

5.1.2.1.1 Testing should be based on samples that represent the “final state” of the material after processing and incorporated into Qorvo’s final products. Materials should be cured or plated into solid form. Liquid plating baths or uncured samples may not be accepted.

5.1.2.1.1.1 NOTE – Test labs may be able to do this for you as part of the sample preparation process. Please ensure the lab report indicates how this was done and includes a photo of the cured/plated material. See Appendix A for examples.

5.1.2.1.2 Independent lab testing shall be performed by an ISO 17025 Certified Test Lab. Upon request, supplier shall provide the current ISO 17025 certificate for the external laboratory.

5.1.2.1.3 Test reports should be updated annually and never be more than 12 months old, based on the report date in the test report.

5.1.2.1.4 Test reports must contain:

- the name and address of the laboratory
- references to the accreditation of the laboratories, inspection body, or certification body
- the results of the lab reports, along with any method, quantitation, and detection limits.
- a description of the methods of sample preparation and analysis used. This can be in the form of a flow chart
- a picture of the material that as tested
5.2  Documentation Control and Recordkeeping

5.2.1  All documentation regarding Product Compliance should be maintained within a document control system that allows traceability to the products and to the organizations that created the documents. Supplier should maintain all documentation supporting material declarations, certificates of compliance, and analytical reports for a minimum of 10 years. Supporting documentation should be checked for consistency between material declarations, SDSs, and/or analytical reports. Discrepancies between any of this documentation should be resolved.
6 3rd Party Lab Analysis Requirements

Table 1 below lists the substances and substance categories for which Qorvo requires 3rd Party Test reports. Table 1 lists:

- The substance or substance category that is restricted or banned.
- The materials that are required to be tested for the listed substance or substance category
- The reason that Qorvo has this testing requirement
- The analytical methods and equipment to be used for this testing requirement and the detection limit required.

| Mercury (Hg)            | All Materials          | EU RoHS                         | Test Equipment: ICP-AES/OES, AAS, ICP-MS, TD-AAS, CV-AAS/AFS Sample Preparation: Closed system for acid decomposition method (e.g. a microwave decomposition method) Typical methods are as follows:  
(1) Closed system for acid decomposition method (e.g. a microwave decomposition method)  
(2) A heating evaporation-cold-vapor mercury-atomic-absorption method  
(3) A wet decomposition method (e.g. Kjeldahl method) in which a decomposition flask with a reflux condenser is used to decompose mercury by sulfuric acid or nitric acid  
Note: In the process of sample preparation, particular attention is required to avoid mercury sublimation, and precipitates must be completely dissolved by some technical means. Test Method: IEC 62321-4:2013  
Note: When the mercury concentration is predicted to be low, you are advised to use one of the following methods:  
(1) A reduction-evaporation atom-absorption method  
(2) ICP-OES (ICP-AES) method with a hydride-generation apparatus  
(3) ICP-MS method with a hydride-generation apparatus  
Note: If a combination of a sample preparation method and a measurement method can ensure that the limit of quantification for mercury is ≤ 2 ppm if the material being tested is not a battery, the combination is applicable. If the material being tested is a battery, a detection limit of ≤ 1 ppm is required. |
| Polybrominated Biphenyls (PBBs) | All materials except metals or glass | EU RoHS                         | Test Equipment: GC/MS, GC/ECD, HPLC/UV, IAMS Test Method: IEC 62321-6:2015  
Note: The detection limit should be ≤ 5 ppm. |
