

Product Overview

Qorvo's TGA2237 is a wideband distributed amplifier fabricated on Qorvo's production 0.25 μm GaN on SiC process (QGaN25). The TGA2237 operates from 0.03 – 2.5 GHz and provides 10 W of saturated output power with 13 dB of large signal gain and greater than 52% power-added efficiency.

The broadband performance supports both radar and communication applications across defense and commercial markets as well as electronic warfare. The TGA2237 is fully matched to 50 Ω at both RF ports allowing for simple system integration. DC blocks are required on both RF ports and the drain voltage must be injected through an off chip bias-tee on the RF output port.

Lead-free and RoHS compliant.

Assembly Notes

Component placement and die attachment assembly notes:

- Vacuum pencils and/or vacuum collets are the preferred method of pick up.
- Air bridges must be avoided during placement.
- The force impact is critical during auto placement.
- Conductive epoxy attachment may be used for small-signal low power dissipation die.

Reflow process assembly notes:

- Use AuSn (80/20) solder and limit exposure to temperatures above 300°C to 3-4 minutes, maximum.
- An alloy station or conveyor furnace with reducing atmosphere should be used.
- Do not use any kind of flux.
- Coefficient of thermal expansion matching is critical for long-term reliability.
- Devices must be stored in a dry nitrogen atmosphere.

Interconnect process assembly notes:

- Thermosonic ball bonding is the preferred interconnect technique.
- Force, time, and ultrasonic are critical parameters.
- Aluminum wire should not be used.
