

Product Overview

The TQP9111 is a high efficiency two-stage driver amplifier in a low-cost surface mount package. The amplifier is able to achieve high performance with +46 dBm OIP3 and +32.5 dBm P1dB. This linear amplifier integrates two high performance amplifier stages onto a module allow for a compact system design. The integrated inter-stage match minimizes performance variation that would otherwise be attributed to external matching component value and placement tolerances.

Both the input and output stage amplifiers are bias adjustable allowing the amplifier's power consumption to be reduced for occasions when high power performance is not required. Both stages can also be turned off when not being used for power saving or for TDD systems. The output match is externally tunable to allow the amplifier to be optimized for high power or high linearity applications.

The TQP9111 is in a RoHS-compliant 20-pin 4 x 4 mm surface mount package.

Application Note – Reduced Bias Configurations TQP9111-PCB2140

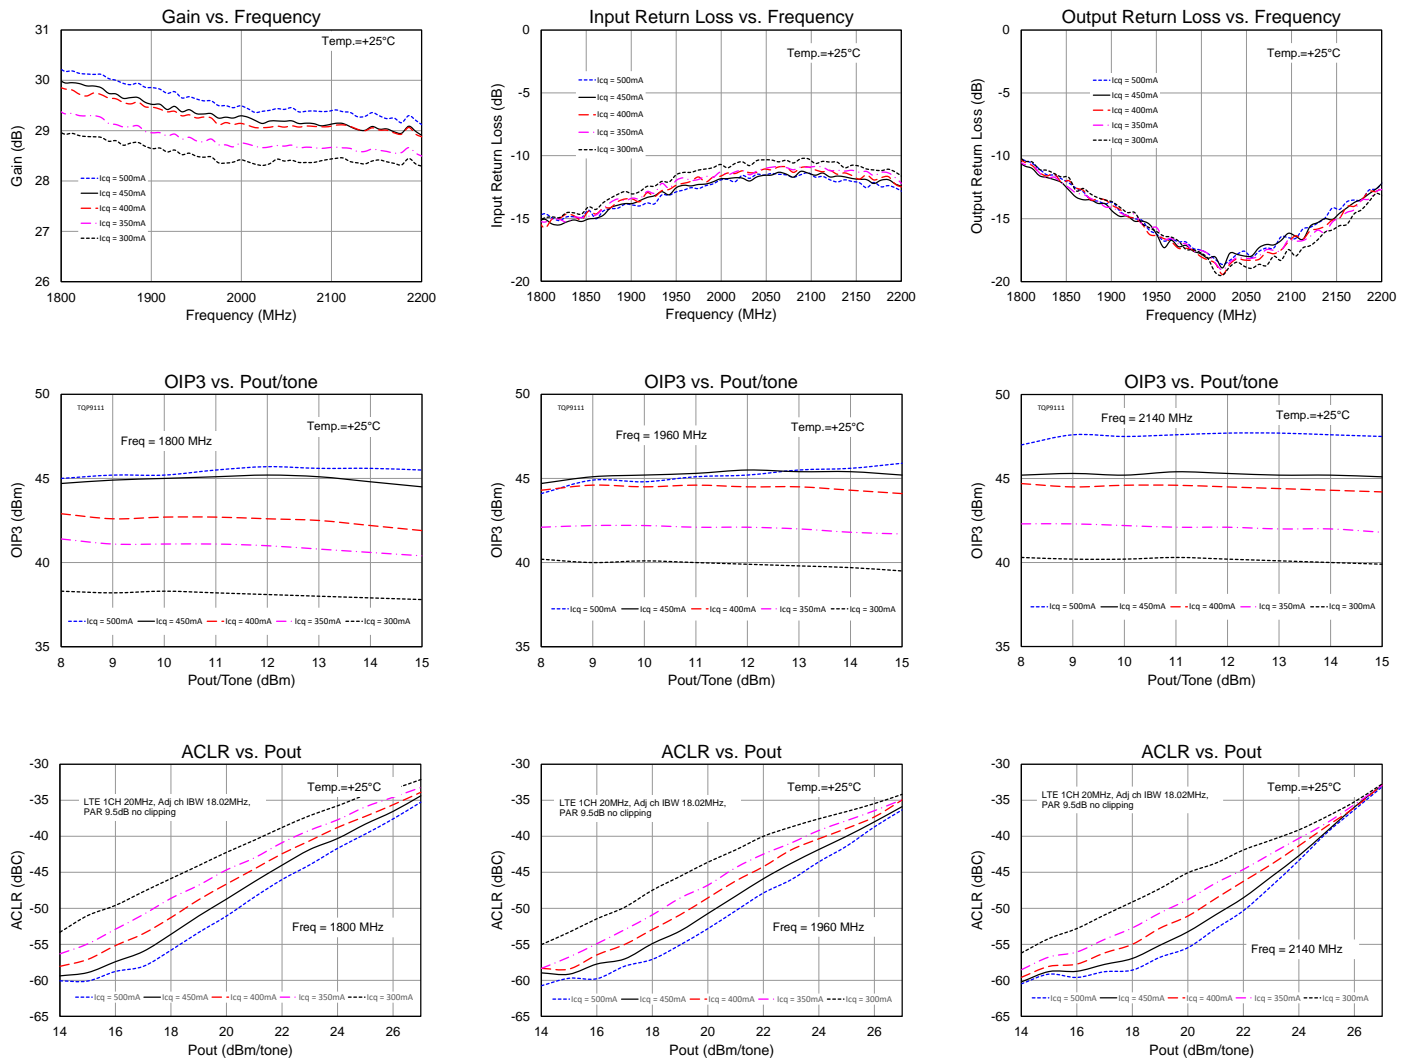

The TQP9111 can be configured to be operated with lower bias current by varying the bias-adjust resistor – R7. The recommended circuit configurations shown previously in this datasheet have the device operating in Class A/B operation. Lowering the current has small effect on the S-parameters and P1dB performance of the device, but will start to lower the OIP3 and ACLR/ACPR performance of the device as shown below. An example of the measured data below represents the TQP9111 measured and configured for 1.8 to 2.2 GHz applications. It is expected that variation of the bias current for other frequency applications will produce similar performance results.

R7 (Ohms)	Ic _q (mA)	P _{diss} (W)	P1dB (dBm)	OIP3 (dBm)
110	500	2.5	+32.3	+47.6
125	450	2.25	+32.3	+45.4
144	400	2.0	+32.3	+44.6
163	350	1.75	+32.3	+42.1
200	300	1.5	+32.3	+40.3
