1. STYLES AND FORMATTING CONVENTIONS

1.1. Overview

This chapter describes formatting and styles used through the document.

1.2. Number Representation

Numbers in a base other than decimal have a prefix or postfix as indicator. All numbers use little endian formatting, most significant bit/digit is to the left. Digits for binary and hexadecimal representation are grouped with a single space every four digits to improve readability. Binary numbers use “b” as postfix, hexadecimal numbers use “0x” as prefix.

For example 1011b binary = 0xB hexadecimal = 11 decimal.

1.3. Formatting Styles

| TYPE | EXAMPLE | DESCRIPTION |
|--------------------------------------|---------------------------------------|---|
| Register Name | RTCCTL | Register names use capital letter and bold formatting. |
| Register Bit(s) | RTCCTL.RTCCLKDIV | Register bits are always represented with the register name separated with a period |
| Function selected by Register bit(s) | [RTCCTL.RTCCLKDIV] | Within text blocks, functions selected with a register bit setting are set in brackets. For example [RTCCTL.RTCCLKDIV] means divider settings /2 to / 65536. |
| Pin Function | XIN | Pin functions use capital letters |
| Formulas | CLK = FCLK / DIV | Formulas use Teletype font. |
| Links | Number Representation | Clickable Links are underlined and blue |
| CPU Mnemonic | MRS | CPU Mnemonic use Teletype font. |
| Operands | { <i>Rd</i> , } <i>Rn</i> , <i>Rm</i> | Operands use Italic |
| Code examples | B loopA | Code examples use Teletype font. |

2. MEMORY AND REGISTER MAP

2.1. Memory Map

Figure 2-1. Memory Map

| 0x0010 0040 | Reserved | PACIDR | Reserved | | |
| 0x0010 0050 - 0x0010 00FF | Reserved | | | | |

3.1.2. ROSC11

Register 3-1. ROSC11 (ROSC11 Frequency Value, 0x0010 0010)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|--------|--------|---|
| 31:0 | ROSC11 | R | ROSC frequency in Hz at setting 11b (8MHz). |

3.1.3. ADCGAIN

Register 3-2. ADCGAIN (ADC Gain Value, 0x0010 0020)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|---------|--------|--|
| 31:0 | ADCGAIN | R | ADC gain (in ADC counts/volt) * 65536. |

3.1.4. ADCOFF

Register 3-3. ADCOFF (ADC Offset, 0x0010 0024)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|--------|--------|---|
| 31:0 | ADCOFF | R | Two's complement of the ADC offset * 65536. The value of this field is in ADC counts. |

3.1.5. FTTEMP

Register 3-4. FTTEMP (FT Temp value, 0x0010 0028)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|---------------|--------|--|
| 15:0 | FTTEMP | R | Test temperature for internal temp sensor in °C ¹ |

3.1.6. TEMPS

Register 3-5. TEMPS (Temperature Sensor reading, 0x0010 002A)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|--------------|--------|---|
| 15:0 | TEMPS | R | Internal temp sensor ADC reading at FTTEMP ² |

3.1.7. CLKREF

Register 3-6. CLKREF (CLKREF Frequency Value, 0x0010 002C)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|---------------|--------|------------------------------|
| 31:0 | CLKREF | R | 4MHz CLKREF frequency in Hz. |

3.1.8. PACIDR

Register 3-7. PACIDR (PAC part number and revision, 0x0010 0044)

| BIT | NAME | ACCESS | DESCRIPTION |
|------|---------------|--------|----------------------------------|
| 31:0 | PACIDR | R | Device part number and revision. |

3.2. Details of Operation

3.2.1. Overview

The Information block has calibration data for the clocks ROSC and CLKREF, Voltage reference VREF, ADC gain and offset and internal temp sensor, that can be used by firmware for more accurate time and ADC readings.

Also stored are device part number and revision for firmware to verify before running application code.

¹ Note that this field may be set to 0xFFFF on some devices. If this is the case, use a value of 25.

² Note that this field may be set to 0xFFFF on some devices. If this is the case, use a value of 614.

4. SYSTEM CLOCK CONTROL

4.1. Register

4.1.1. Register Map

Table 4-1. System Clock Control Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|-----------------------------|----------------|-------------------------|-------------|
| System Clock Control | | | |
| 0x4000 0000 | CCSCTL | System clock control | 0x0000 0000 |

| 0 | ROSCEN | RW | 0x1 | Enable Ring oscillator 1b: enable ROSC 0b: disable ROSC |

4.1.5. XTALCTL

Register 4-4. XTALCTL (Crystal Driver Control, 0x4000 000C)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:1 | Reserved | R | 0x0 | Reserved |
| 0 | XTALEN | RW | 0x0 | Enable XTAL driver 1b: enable crystal driver 0b: disable crystal driver |

4.2. Details of Operation

4.2.1. Block Diagram

Figure 4-1. System Clock Control

4.2.2. Configuration

Following blocks need to be configured for correct use of the system clock control:

- GPIO.DPD1
- RTC
- WDT
- WIC
- ADC/ASC
- SYSTICK
- SRAM
- FLASH
- ADC EMUX
- SOC BUS
- I2C

- SPI
- UART
- Timer A, B, C, D

4.2.3. ROSC

The internal ring oscillator has four frequency settings controllable with **OSCCTL.ROSCP** from 8.3MHz to 28.7MHz in four steps. The ROSC can also be disabled using **OSCCTL.ROSCEN**.

4.2.4. CLKREF

The CLKREF provides a 2% trimmed 4MHz clock.

4.2.5. XTAL

The crystal driver supports a range of crystal frequencies from 2MHz to 10MHz. The crystal driver can also be used to input an external clock using XIN.

The crystal driver can be enabled with **XTALCTL.XTALEN**.

4.2.6. EXTCLK

PD1 can be configured as clock input, EXTCLK.

4.2.7. PLL

The clock input to the PLL is FRCLK.

The PLL can be enabled with **PLLCTL.PLLEN**.

The PLL output clock PLLOUT is following following equation:

$$PLLOUT = \frac{PLLIN * PLLFBDIV}{PLLINDIV * PLLOUTDIV * 2} \quad (1)$$

Where:

PLLOUT: PLL output frequency in MHz

PLLIN: PLL input frequency in MHz (FRCLK)

PLLINDIV: PLL input divider (2 to 33) **PLLCTL.PLLINDIV**

PLLFBDIV: PLL feedback divider (2 to 513) **PLLCTL.PLLFBDIV**

PLLOUTDIV: PLL output divider (1 to 16) **PLLCTL.PLLOUTDIV**

The input clock frequency and input clock divider selection must follow formula below for correct operation of PLL:

$$1\text{MHz} \leq \frac{PLLIN}{PLLINDIV} \leq 25\text{MHz} \quad (2)$$

The output clock frequency and output clock divider selection must following formula below for correct operation of the PLL

$$100\text{MHz} \leq PLLOUT * PLLOUTDIV \leq 250\text{MHz} \\ PLLOUTDIV \geq 1 \quad (3)$$

The table below shows pre-calculated PLL output frequency settings using the 4MHz ROSC as input.

Table 4-5. PLL output frequency settings using 4MHz ROSC as input

| PLL output | PLLOUTDIV | PLLFBDIV | PLLINDIV |
|------------|---------------|--------------|----------|
| 10MHz | 0x01 (/[1*2]) | 0x008 (*10) | 0x0 (/2) |
| 16.8MHz | 0x05 (/[5*2]) | 0x052 (*84) | 0x0 (/2) |
| 20MHz | 0x01 (/[1*2]) | 0x012 (*20) | 0x0 (/2) |
| 25MHz | 0x01 (/[1*2]) | 0x019 (*25) | 0x0 (/2) |
| 30MHz | 0x01 (/[1*2]) | 0x01C (*30) | 0x0 (/2) |
| 33.333MHz | 0x01 (/[1*2]) | 0x030 (*50) | 0x1 (/3) |
| 40MHz | 0x01 (/[1*2]) | 0x026 (*40) | 0x0 (/2) |
| 50MHz | 0x01 (/[1*2]) | 0x030 (*50) | 0x0 (/2) |
| 60MHz | 0x01 (/[1*2]) | 0x03A (*60) | 0x0 (/2) |
| 70MHz | 0x01 (/[1*2]) | 0x044 (*70) | 0x0 (/2) |
| 80MHz | 0x01 (/[1*2]) | 0x04E (*80) | 0x0 (/2) |
| 90MHz | 0x01 (/[1*2]) | 0x058 (*90) | 0x0 (/2) |
| 100MHz | 0x01 (/[1*2]) | 0x062 (*100) | 0x0 (/2) |

4.2.8. FRCLK

The free running clock FRCLK clock source can be selected with **CCSCTL.CLKIN**. From XTAL, EXTCLK, CLKREF, or ROSC.

4.2.9. FCLK

The fast clock FCLK clock source can be selected with **CCSCTL.FCLK** to be either PLLOUT or FRCLK.

4.2.10. HCLK

The high speed clock HCLK clock source input is FCLK. The HCLK can be divided down from FCLK using **CCSCTL.HCLKDIV** from /1 to /8 in 4 steps.

4.2.11. ACLK

The auxiliary clock ACLK clock source input is FCLK. The ACLK can be divided down from FCLK from /1 to /128 in 8 steps.

4.2.12. Clock Gating

When the CPU enters deep sleep mode, the HCLK, ACLK and FCLK to the ADC are clock gated and stopped to save power. Only FRCLK and FCLK continue to run to supply WIC, RTC, and WDT.

5. WATCHDOG TIMER

5.1. Register

5.1.1. Register Map

Table 5-1. Watchdog Timer Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|-----------------------|---------------|---------------------------------|-------------|
| Watchdog Timer | | | |
| 0x4003 0000 | WDTCTL | Watchdog timer control | 0x6300 0000 |
| 0x4003 0004 | WDTCDV | Watchdog timer count-down value | 0x63FF FFFF |
| 0x4003 0008 | WDTCTR | Watchdog timer counter | 0x00FF FFFF |

5.1.2. WDTCTL

Register 5-1. WDTCTL (Watchdog Timer Control, 0x4003 0000)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|------------------|--------|-------|--|
| 31:24 | KEY | RW | 0x63 | Key for writing WDTCTL register 0x4A: allow writes to WDTCTL register 0x63: read value of WDTCTL.KEY |

| 11 | WRBUSY | RW | 0x0 | WDTCTL write busy 1b = write to WDTCTL still being processed. Any register writes received while this bit is set to a 1b will be dropped and not written to the given register. Any reads will return indeterminate data. 0b = WDT registers not busy |
| 10 | WDTCLKSEL | RW | 0x0 | WDT input clock select 1b: FCLK 0b: FRCLK |
| 9:6 | WDTCLKDIV | RW | 0x0 | WDT clock input divider 1111b: /65536 1110b: /32768 1101b: /16384 1100b: /8192 1011b: /4096 1010b: /2048 1001b: /1024 1000b: /512 0111b: /256 0110b: /128 0101b: /64 0100b: /32 0011b: /16 0010b: /8 0001b: /4 0000b: /2 |
| 5 | WDRESETEN | RW | 0x0 | Watchdog device RESET enable 1b = WDT trigger device RESET when WDTCTR register counts to 0x0 0b = WDT trigger device RESET disabled |
| 4 | WDTINT | RW | 0x0 | Watchdog interrupt 1b = WDT interrupt 0b = no WDT interrupt |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|------------------|--------|-------|--|
| 3 | WDTINTEN | RW | 0x0 | Watchdog interrupt enable 1b = enable WDT interrupt 0b = disable WDT interrupt |
| 2:0 | WDTCTRRST | RW | 0x0 | WDTCTR counter reset 101b = write of 101b reset WDTCTR to WDTCDV value |

5.1.3. WDTCDV

Register 5-2. WDTCDV (Watchdog Timer Count-Down Value, 0x4003 0004)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-----------|--|
| 31:24 | KEY | RW | 0x63 | Key for writing WDTCDV register 0x4A: allow writes to WDTCDV register 0x63: read value of WDTCDV.KEY |
| 23:0 | RSTVALUE | RW | 0xFF FFFF | 24-bit WDT count-down value |

5.1.4. WDTCTR

Register 5-3. WDTCTR (Watchdog Timer Counter, 0x4003 0008)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-----------|----------------------|
| 31:24 | Reserved | R | 0x0 | Reserved |
| 23:0 | CTR | RW | 0xFF FFFF | Current value of WDT |

5.2. Details of Operation

5.2.1. Block Diagram

Figure 5-1. WDT

5.2.2. Configuration

Following blocks need to be configured for correct use of the WDT:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)

5.2.3. Watchdog Timer

The Watchdog timer consist of a 24-bit timer and reset logic. The WDT can be used as general purpose 16bit timer or as watchdog timer that need to be serviced periodically to avoid device reset.

5.2.4. Access WDT Registers

The **WDTCTL** and **WDTCDV** registers can only be written to if **WDTCTL.KEY** or **WDTCDV.KEY** are set to 0x4A.

The read back value of **WDTCTL.KEY** or **WDTCDV.KEY** is always 0x63. The watchdog timer has 2 clock domains, HCLK and WDT clock domain set by **WDTCTL.CLKSEL** and **WDTCTL.WDTCLKDIV**. Writing to any WDT registers may take up to 1 clock cycle on the WDT clock domain to finish. Any ongoing writes to WDT registers are shown with **WDTCTL.WRBUSY**. As long as **WDTCTL.WRBUSY** is 1b, any subsequent writes to WDT registers are ignored and reads only provide undetermined data.

5.2.5. WDT Clock Setting

The WDT can use 2 clocks FCLK or FRCLK, selectable with **WDTCTL.CLKSEL**. For applications where the WDT need to run in CPU sleep mode, FRCLK should be used. The clock input can be further divided down from /2 to /65536 using **WDTCTL.WDTCLKDIV**.

5.2.6. General Purpose Timer Mode

Set **WDTCTL.WDTRESETEN** to 0b to use the WDT as general purpose 24-bit timer. Set the desired count value in WDT clocks in **WDTCDV.RSTVALUE**, set **WDTCTL.WDTCTRRST** to 101b to load **WDTCTR.CTR** with **WDTCDV.RSTVALUE**. To start the GPT timer set **GPTCTL.INTEN**. When **WDTCTR.CTR** reaches 0x0, the timer

automatic reloads **WDTCTR.CTR** with **WDTCDV.RSTVALUE** and continues countdown. The WDT is stopped when **WDTCTL.INTEN** is cleared.

5.2.7. Watchdog Timer Mode

Set **WDTCTL.WDTRESETEN** to 1b to use the WDT as 24-bit watchdog timer with device reset capability. Set **WDTCTL.WDTINTEN** to 1b to enable interrupt when WDT counts to 0x0. Set the desired count value in WDT clocks in **WDTCDV.RSTVALUE**. To start the WDT count down, set **WDTCTL.WDTCTRRST** to 101b. The WDT will copy the **WDTCTL.RSTVALUE** to **WDTCTR.CTR** and start counting down. When **WDTCTR.CTR** reaches 0x0, the WDT will automatic copy **WDTCTL.RSTVALUE** to **WDTCTR.CTR**, restart the counter and set the interrupt flag if enabled is set. During the second count down, set **WDTCTL.WDTCTRRST** to 101b to restart the 1st WDT countdown and avoid device reset. If the **WDTCTR.CTR** reaches 0x0 during the second count down without being reloaded, the WDT will toggle device reset.

6. GPIO PORT A

6.1. Register

6.1.1. Register Map

Table 6-1. GPIO Port A Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|--------------------|-------------------|---------------------------------------|-------------|

| 2 | P2 | RW | 0x0 | Port A 2 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 1 | P1 | RW | 0x0 | Port A 1 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 0 | P0 | RW | 0x0 | Port A 0 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |

6.1.12. GPIOAINTM

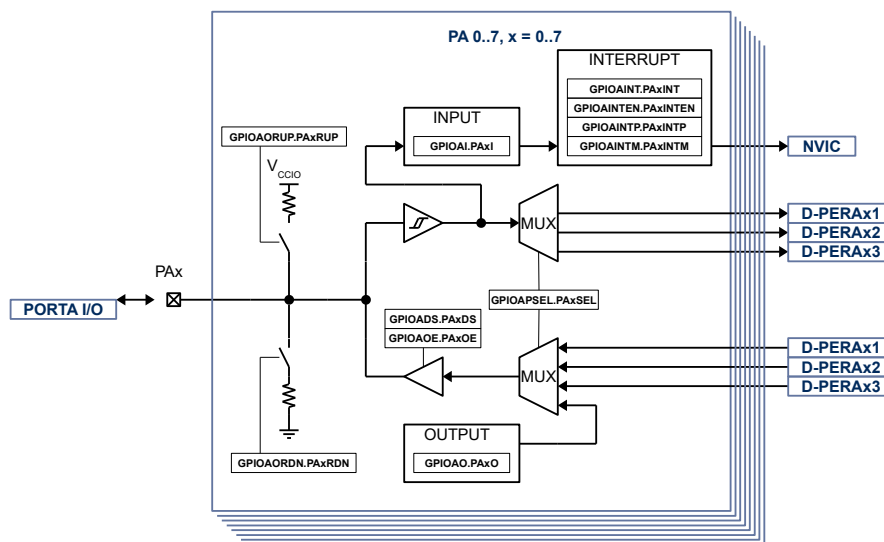

Register 6-11. GPIOAINTM (GPIO Port A Interrupt Mask, 0x4007 002C)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:8 | Reserved | RO | 0x0 | Reserved |
| 7 | P7 | RW | 0x0 | Port A 7 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 6 | P6 | RW | 0x0 | Port A 6 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 5 | P5 | RW | 0x0 | Port A 5 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 4 | P4 | RW | 0x0 | Port A 4 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 3 | P3 | RW | 0x0 | Port A 3 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 2 | P2 | RW | 0x0 | Port A 2 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 1 | P1 | RW | 0x0 | Port A 1 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 0 | P0 | RW | 0x0 | Port A 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |

6.2. Details of Operation

6.2.1. Block Diagram

Figure 6-1. GPIO Port A

6.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO A:

- Nested Vectored Interrupt Controller (NVIC)
- Gate Driver
- Timer A, PWMA, DTGA
- Timer B, PWMB, DTGB
- Timer C, PWMC, DTGC
- Timer D, PWMD, DTGD
- General Purpose Gate Drivers

6.2.3. GPIO A Block

The GPIO A block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation. Some of the GPIO can be configured as PWM output, or capture and compare input.

6.2.4. Input

The input state of GPIOA can be monitored with **GPIOAIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIOAPSEL**.

6.2.5. Output and Output Enable

When **GPIOAOUTEN.Px** is enabled, the output state is controlled by **GPIOAOUT.Px**.

When **GPIOAOUTEN.Px** is disabled, the output is in High-Z state.

6.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIOADS** to meet application needs. Set **GPIOADS.Px** to enable high current drive strength, reset to enable low current drive strength.

6.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIOAPU** and weak pull down can be enabled with **GPIOAPD**.

NOTE:

GPIOAPU.Px or **GPIOAPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

6.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIOAPSEL**. When a different function than IO is selected the input state can still be read with **GPIOAIN** and the pull-up and pull-down is still controllable.

6.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIOAINTEN**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOAINTP**. The state of the interrupt can be read from **GPIOAINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOAINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

7.2. Details of Operation

7.2.1. Block Diagram

Figure 7-1. GPIO Port B

7.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO B:

- Nested Vectored Interrupt Controller (NVIC)
- SOC Bus

7.2.3. GPIO B Block

The GPIO B block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation. Some of the GPIO can be configured as PWM output, or capture and compare input.

7.2.4. Input

The input state of GPIOB can be monitored with **GPIOBIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIOBPSSEL**.

7.2.5. Output and Output Enable

When **GPIOBOUTEN.Px** is enabled, the output state is controlled by **GPIOBOUT.Px**.

When **GPIOBOUTEN.Px** is disabled, the output is in High-Z state.

7.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIOBDS** to meet application needs. Set **GPIOBDS.Px** to enable high current drive strength, reset to enable low current drive strength.

7.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIOBPU** and weak pull down can be enabled with **GPIOBPD**.

NOTE:

GPIOBPU.Px or **GPIOBPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

7.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIOBPSEL**. When a different function than IO is selected the input state can still be read with **GPIOBIN** and the pull-up and pull-down is still controllable.

7.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIOBINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOBINTP**. The state of the interrupt can be read from **GPIOBINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOBINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

| 5 | P5 | RW | 0x0 | Port C 5 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD5 ADC input operation |
| 4 | P4 | RW | 0x0 | Port C 4 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD4 ADC input operation |
| 3 | P3 | RW | 0x0 | Port C 3 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD3 ADC input operation |
| 2 | P2 | RW | 0x0 | Port C 2 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD2 ADC input operation |
| 1 | P1 | RW | 0x0 | Port C 1 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD1 ADC input operation |
| 0 | P0 | RW | 0x0 | Port C 0 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD0 ADC input operation |

8.1.6. GPIOCINTP

Register 8-5. GPIOCINTP (GPIO Port C Interrupt Polarity, 0x4008 0020)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | RO | 0x0 | Reserved |
| 7 | P7 | RW | 0x0 | Port C 7 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 6 | P6 | RW | 0x0 | Port C 6 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 5 | P5 | RW | 0x0 | Port C 5 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 4 | P4 | RW | 0x0 | Port C 4 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 3 | P3 | RW | 0x0 | Port C 3 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 2 | P2 | RW | 0x0 | Port C 2 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 1 | P1 | RW | 0x0 | Port C 1 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |
| 0 | P0 | RW | 0x0 | Port C 0 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition |

8.1.7. GPIOCINTE

Register 8-6. GPIOCINTE (GPIO Port C Interrupt Enable, 0x4008 0024)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | RO | 0x0 | Reserved |
| 7 | P7 | RW | 0x0 | Port C 7 interrupt enable 1b: enabled interrupt 0b: disable interrupt |
| 6 | P6 | RW | 0x0 | Port C 6 interrupt enable 1b: enabled interrupt 0b: disable interrupt |
| 5 | P5 | RW | 0x0 | Port C 5 interrupt enable 1b: enabled interrupt 0b: disable interrupt |
| 4 | P4 | RW | 0x0 | Port C 4 interrupt enable 1b: enabled interrupt 0b: disable interrupt |
| 3 | P3 | RW | 0x0 | Port C 3 interrupt enable 1b: enabled interrupt 0b: disable interrupt |
| 2 | P2 | RW | 0x0 | Port C 2 interrupt enable 1b: enabled interrupt 0b: disable interrupt |

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------|--------|-------|---|
| 1 | P1 | RW | 0x0 | Port C 1 interrupt enable 1b: enabled interrupt 0b: disable interrupt |
| 0 | P0 | RW | 0x0 | Port C 0 interrupt enable 1b: enabled interrupt 0b: disable interrupt |

8.1.8. GPIOCINTF

Register 8-7. GPIOCINTF (GPIO Port C Interrupt, 0x4008 0028)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | RO | 0x0 | Reserved |
| 7 | P7 | RW | 0x0 | Port C 7 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 6 | P6 | RW | 0x0 | Port C 6 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 5 | P5 | RW | 0x0 | Port C 5 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 4 | P4 | RW | 0x0 | Port C 4 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 3 | P3 | RW | 0x0 | Port C 3 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 2 | P2 | RW | 0x0 | Port C 2 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 1 | P1 | RW | 0x0 | Port C 1 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |
| 0 | P0 | RW | 0x0 | Port C 0 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending |

8.1.9. GPIOCINTM

Register 8-8. GPIOCINTM (GPIO Port C Interrupt Mask, 0x4008 002C)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:8 | Reserved | RO | 0x0 | Reserved |
| 7 | P7 | RW | 0x0 | Port C 7 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 6 | P6 | RW | 0x0 | Port C 6 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-----------|--------|-------|--|
| 5 | P5 | RW | 0x0 | Port C 5 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 4 | P4 | RW | 0x0 | Port C 4 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 3 | P3 | RW | 0x0 | Port C 3 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 2 | P2 | RW | 0x0 | Port C 2 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 1 | P1 | RW | 0x0 | Port C 1 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |
| 0 | P0 | RW | 0x0 | Port C 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask |

8.2. Details of Operation

8.2.1. Block Diagram

Figure 8-1. GPIO Port C

8.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO C:

- Nested Vectored Interrupt Controller (NVIC)
- ADC

8.2.3. GPIO C Block

The GPIOC block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, High-Z output operation, analog ADx input to the ADC Mux. The GPIOC block IO voltage is different from the other GPIO blocks, it is supplied from VCC33.

8.2.4. Analog Input

The digital input state of GPIOC can be monitored with **GPIOCIN.Px** if **GPIOCINE.Px** is set.

Clear **GPIOCINE.Px** and **GPIOCOUTEN.Px** to disable digital input and output to allow use of analog input ADx to the ADC.

8.2.5. Output and Output Enable

When **GPIOCOUTEN.Px** is enabled, the output state is controlled by **GPIOCOUT.Px**.

When **GPIOCOUTEN.Px** is disabled, the output is in High-Z state.

8.2.6. Interrupt

The interrupt for each GPIO can be enabled with **GPIOCINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOCINTP**. The state of the interrupt can be read from **GPIOCINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOCINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

9. GPIO PORT D

9.1. Register

9.1.1. Register Map

Table 9-1. GPIO Port D Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|--------------------|-------------------|---------------------------------------|-------------|
| GPIO Port D | | | |
| 0x4008 0040 | GPIODOUT | GPIO Port D output | 0x0000 0000 |

9.2. Details of Operation

9.2.1. Block Diagram

Figure 9-1. GPIO Port D

9.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO D:

- Nested Vectored Interrupt Controller (NVIC)
- Gate Driver
- Timer A, PWMA, DTGA
- Timer B, PWMB, DTGB
- Timer C, PWMC, DTGC
- Timer D, PWMD, DTGD
- CCS
- SWD Debugger

9.2.3. GPIO D Block

The GPIO D block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation. Some of the GPIO can be configured as PWM output, or capture and compare input.

9.2.4. Input

The input state of GPIOD can be monitored with **GPIODIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIODPSEL**.

9.2.5. Output and Output Enable

When **GPIODOUTEN.Px** is enabled, the output state is controlled by **GPIODOUT.Px**.

When **GPIODOE.PDxOE** is disabled, the output is in High-Z state.

9.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIODDS** to meet application needs. Set **GPIODDS.Px** to enable high current drive strength, reset to enable low current drive strength.

9.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIODPU** and weak pull down can be enabled with **GPIODPD**.

NOTE:

GPIODPU.Px or **GPIODPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

9.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIODPSEL**. When a different function than IO is selected the input state can still be read with **GPIODIN** and the pull-up and pull-down is still controllable.

9.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIODINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIODINTP**. The state of the interrupt can be read from **GPIODINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIODINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

10. GPIO PORT E

10.1. Register

10.1.1. Register Map

Table 10-1. GPIO Port E Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|--------------------|-------------------|---------------------------------------|-------------|

10.2. Details of Operation

10.2.1. Block Diagram

Figure 10-1. GPIO Port E

10.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO E:

- Nested Vectored Interrupt Controller (NVIC)
- SPI
- I2C
- UART

10.2.3. GPIO E Block

The GPIO E block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation.

10.2.4. Input

The input state of GPIOE can be monitored with **GPIOEIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIOEPSEL**.

10.2.5. Output and Output Enable

When **GPIOEOUTEN.Px** is enabled, the output state is controlled by **GPIOEOUT.Px**.

When **GPIOEOUTEN.Px** is disabled, the output is in High-Z state.

10.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIOEDS** to meet application needs. Set **GPIOEDS.Px** to enable high current drive strength, reset to enable low current drive strength.

10.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIOEPU** and weak pull down can be enabled with **GPIOPD**.

NOTE:

GPIOEPU.Px or **GPIOEPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

10.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIOEPSEL**. When a different function than IO is selected the input state can still be read with **GPIOEIN** and the pull-up and pull-down is still controllable.

10.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIOEINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOEINTP**. The state of the interrupt can be read from **GPIOEINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOEINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

11. GENERAL PURPOSE TIMER

11.1. Register

11.1.1. Register Map

Table 11-1. General Purpose Timer Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|------------------------|---------------|--|-------------|
| Real Time Clock | | | |
| 0x4004 0000 | RTCCTL | Real-time clock timer control | 0x6300 0000 |
| 0x4004 0004 | RTCCDV | Real-time clock timer count-down value | 0x63FF FFFF |
| 0x4004 0008 | RTCCTR | Real-time clock timer counter | 0x00FF FFFF |

11.1.2. RTCCTL

Register 11-1. RTCCTL (Real Time Clock Control, 0x4004 0000)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|------------------|--------|-------|---|
| 31:24 | KEY | RW | 0x63 | Key for writing GPTCTL register 0x4A: allow writes to GPTCTL register 0x63: read value of GPTCTL.KEY |
| 23:12 | Reserved | R | 0x0 | Reserved |
| 11 | WRBUSY | RW | 0x0 | GPTCTL write busy 1b = write to GPTCTL still being processed. Any register writes received while this bit is set to a 1b will be dropped and not written to the given register. Any reads will return indeterminate data. 0b = GPT registers not busy |
| 10 | Reserved | RW | 0x0 | Reserved, write as 0 |

| 5 | Reserved | R | 0x0 | Reserved |
| 4 | GPTINT | RW | 0x0 | Real time clock interrupt 1b = GPT interrupt 0b = no GPT interrupt |
| 3 | GPTINTEN | RW | 0x0 | Real time clock interrupt enable 1b = enable GPT interrupt 0b = disable GPT interrupt |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|------------------|--------|-------|--|
| 2:0 | GPTCTRRST | RW | 0x0 | GPTCTR counter reset 101b = write of 101b reset GPTCTR to GPTCDV value |

11.1.3. RTCCDV

Register 11-2. RTCCDV (Real Time Clock Count-Down Value, 0x4004 0004)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-----------|---|
| 31:24 | KEY | RW | 0x63 | Key for writing GPTCTL register 0x4A: allow writes to GPTCTL register 0x63: read value of GPTCTL.KEY |
| 23:0 | RSTVALUE | RW | 0xFF FFFF | 24bit GPT count-down value |

11.1.4. RTCCTR

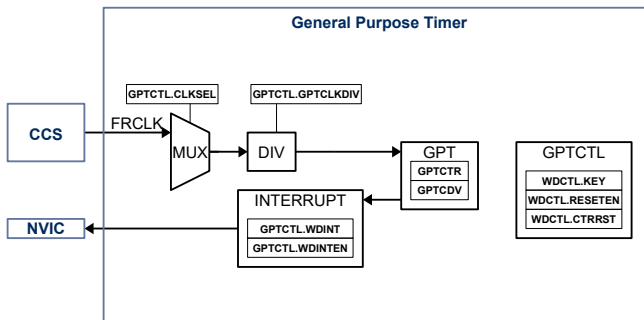

Register 11-3. RTCCTR (Real Time Clock Counter, 0x4004 0008)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-----------|----------------------|
| 31:24 | Reserved | R | 0x0 | Reserved |
| 23:0 | CTR | RW | 0xFF FFFF | Current value of GPT |

11.2. Details of Operation

11.2.1. Block Diagram

Figure 11-1. GPT

11.2.2. Configuration

Following blocks need to be configured for correct use of the GPT:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)

11.2.3. General Purpose Timer

The General purpose timer consist of a 24-bit timer, can also run in device sleep mode if FRLCK is used.

11.2.4. Access GPT Registers

The **RTCCTL** and **RTCCDV** registers can only be written to if **RTCCTL.KEY** or **RTCCDV.KEY** are set to 0x4A.

The read back value of **RTCCTL.KEY** or **RTCCDV.KEY** is always 0x63. The general purpose timer is supplied by the FRCLK. The GPT may divide this input clock by using the **RTCCTL.GPTCLKDIV**. Writing to any GPT registers may take up to 1 clock cycle on the GPT clock domain to finish. Any ongoing writes to GPT registers are shown with **RTCCTL.WRBUSY**. As long as **RTCCTL.WRBUSY** is 1b, any subsequent writes to GPT registers are ignored and reads only provide undetermined data.

11.2.5. GPT Clock

The GPT uses FRCLK as its input clock. For applications where the GPT need to run in CPU sleep mode, FRCLK should be used. The clock input can be further divided down from /2 to /65536 using **RTCCTL.GPTCLKDIV**.

11.2.6. General Purpose Timer Mode

Set **RTCCTL.GPTRESETEN** to 0b to use the GPT as general purpose 24-bit timer. Set the desired count value in GPT clocks in **RTCCDV.RSTVALUE**, set **RTCCTL.GPTCTRRST** to 101b to load **RTCCTR.CTR** with **RTCCDV.RSTVALUE**. To start the GPT timer set **RTCCTL.INTEN**. When **RTCCTR.CTR** reaches 0x0, the timer automatic reloads **RTCCTR.CTR** with **RTCCDV.RSTVALUE** and continues countdown. The GPT is stopped when **RTCCTL.INTEN** is cleared.

12.2. Details of Operation

12.2.1. Block Diagram

Figure 12-1. Timer A

12.2.2. Configuration

Following blocks need to be configured for correct use of the Timer A:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- I/O Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer B
- Timer C
- Timer D

12.2.3. Timer A Block

The timer A block consist of a 16-bit timer with up mode or up/down mode with 8 PWM/capture units and 4 dead-time generator units.

12.2.4. Timer

Once enabled the timer counts up to the Timer A period value **TAPRD**. The **TAPRD** register can be written to

while the timer is running, the new **TAPRD** value will be latched when the counter reaches old **TAPRD** value in up mode. In up/down mode there is the option to latch the new **TAPRD** value when counter counts back to zero. **TACTL.PRDL** configures when the timer will be updated with the new **TAPRD** value in up/down mode.

The current timer value is accessible with the timer A counter value register **TACTR**.

12.2.5. Register update

The **TAPRD**, **TACCxCTR** register can be written to while the timer is running, the new **TAPRD**, **TACCxCTR** value will be latched when the counter reaches old **TAPRD** value in up mode. In up/down mode there is the option to latch the new **TAPRD**, **TACCxCTR** values when counter counts back to zero. **TACTL.PRDL** configures when the timer will be updated with the new **TAPRD**, **TACCxCTR** value in up/down mode.

12.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TACTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TACTR** to zero use **TACTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TAPRD**. When the timer counter reaches the value of **TAPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TAPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down

12.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TACTL.SS** the timer will only count to **TAPRD** value and stops in up mode. In up/down mode the timer will count to **TAPRD** and back to zero only once.

To start the timer in single-shot mode, **TACTL.SS** must be set. The timer will start when **TACTL.CLR** is set. To re-start a single-shot timer, **TACTL.CLR** must be reset, and then set again.

12.2.8. Input Clock And Pre-Scaler

The timer can be configured to use HCLK or ACLK using **TACTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TACTL.CLKDIV**.

12.2.9. Timer Synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (SYNC_IN) and the synchronization out signal (SYNC_OUT).

Timer A can be synchronized with Timer B, C, and D with timer A as master.

The timer asserts the SYNC_OUT pulse when the **TACTL.CLR** bit is set and de-asserts the SYNC_OUT pulse when the **TACTL.CLR** bit is cleared.

Each timer B, C, or D that need to be synchronized as slave with master timer A need to set the **TxCTL.SYNC** bit. If this bit is not set, then the sync_in signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is asserted, the timer clears the timer counter. The

timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the **SYNC_IN** signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. All slave timers B, C, or D are configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TACTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TACTL.CLR** signal, to assert the **SYNC_OUT** signal. The timers can be re-enabled by clearing the **TACTL.CLR** bit, which de-asserts the **SYNC_OUT** signal.

12.2.10. PWM/Compare Units

Timer A supports up to 8 PWM/Capture units PWMA0 to PWMA7. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TACCxCTL.CCMODE**.

12.2.10.1. PWM Mode

The PWM mode is enabled with setting **TACCxCTRL.CCMODE** to 0.

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TACTR** value of 0 and then transitions to low when **TACTR** counts up to **TACCxCTR** compare value.

To configure a duty cycle of 0%, the **TACCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TACCxCTR** value should be set to a value greater than or equal to **TAPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 12-2. PWMA[x] and PWMA[x+4] Example Using Timer A Up Mode and Up/Down Mode

12.2.10.2. Capture Mode

The Capture mode is enabled with setting **TACCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TACCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TACTR** value is copied into **TACCxCTR**.

Figure 12-3. CA[x] and CA[x+4] Capture Example

12.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TACTL.INT** interrupt flag is set. If the interrupt is enabled using the **TACTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TACTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TACCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TACCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TACCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TACTL.INT** or **TACCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

12.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer A block supports up to 4 dead time generators.

12.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGx can be selected using **TACTL.DTGCLK**.

Clear **TACTL.DTGCLK** to 0 to use clock source selected by **TACTL.CLK** directly to use higher resolution for dead time insertion.

Set **TACTL.DTGCLK** to 1 to use divided clock source selected by **TACTL.CLK** and **TACTL.CLKDIV** divider to use the same dead time resolution as Timer A.

12.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently for each DTG using **DTGxLED** and **DTGxTED**.

12.2.12.3. Bypass Mode

Set **DTGxCTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGxCTL.BYPASS** to 1 to enable bypass mode, no deadtime is inserted, PWMA[x+4] is routed to DTGxHS and PWMx is routed to DTGxLS.

The DTGxHS and DTGxLS signals can be inverted in bypass mode.

Figure 12-4. DTGx Bypass Example

12.2.12.4. Inverting PWM Signal

The DTG output signals DTGxHS and DTGxLS can be inverted independently.

Set **DTGxCTL.INVHS** to invert DTGxHS signal.

Set **DTGxCTL.INVLS** to invert DTGxLS signal.

Figure 12-5. DTGx Bypass and Inverting LS Example

12.2.12.5. Dead Time Insertion

Set **DTGxCTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWM[x+4] signal is used to generate DTGxHS and DTGxLS. PWMA[x] signal is ignored and can be used for other purposes.

Set **DTGxLED** for desired leading-edge and **DTGxTED** for desired trailing edge in clock-cycles defined by **TACTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGxLS signal is automatically inverted compared to PWMA[x+4] signal. Set **DTGxCTL.INVLS** to 0, if this is desired behavior.

Figure 12-6. DTGx LED and TED Example

12.2.12.6. Dead Time Insertion with On Time Preservation

Set **DTGxCTL.OTP** to 1 to enable on time preservation. In this mode the DTGxHS is same as PWM[x+4] on time.

NOTE:

In dead time insertion mode the DTGxLS signal is automatically inverted compared to PWMA[x+4] signal. Set **DTGxCTL.INVLS** to 0, if this is desired behavior.

Figure 12-7. DTGx LED and TED with On Time Preservation Example

12.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGxHS, DTGxLS outputs, and Cx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

13.2. Details of Operation

13.2.1. Block Diagram

Figure 13-1. Timer B

13.2.2. Configuration

Following blocks need to be configured for correct use of the Timer B:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer A
- Timer C
- Timer D
-

13.2.3. Timer B Block

The timer B block consist of a 16-bit timer with up mode or up/down mode with 4 PWM/capture units and 1 dead-time generator unit.

13.2.4. Timer

Once enabled the timer counts up to the Timer B period value **TBPRD**. The **TBPRD** register can be written to while the timer is running, the new **TBPRD** value will be latched when the counter reaches old **TBPRD** value in up mode. In up/down mode there is the option to latch the new **TBPRD** value when counter counts back to zero.

TBCTL.PRDL configures when the timer will be updated with the new **TBPRD** value in up/down mode. The current timer value is accessible with the timer B counter value register **TBCTR**.

13.2.5. Register update

The **TBPRD**, **TBCCxCTR** register can be written to while the timer is running, the new **TBPRD**, **TBCCxCTR** value will be latched when the counter reaches old **TBPRD** value in up mode. In up/down mode there is the option to latch the new **TBPRD**, **TBCCxCTR** values when counter counts back to zero. **TBCTL.PRDL** configures when the timer will be updated with the new **TBPRD**, **TBCCxCTR** value in up/down mode.

13.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TBCTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TBCTR** to zero use **TBCTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TBPRD**. When the timer counter reaches the value of **TBPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TBPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down.

13.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TBCTL.SS** the timer will only count to **TBPRD** value and stops in up mode. In up/down mode the timer will count to **TBPRD** and back to zero only once.

To start the timer in single-shot mode, **TBCTL.SS** must be set. The timer will start when **TBCTL.CLR** is set. To re-start a single-shot timer, **TBCTL.CLR** must be reset, and then set again.

13.2.8. Input Clock And Pre-Scaler

The timer can be configured to use HCLK or ACLK using **TBCTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TBCTL.CLKDIV**.

13.2.9. Timer Synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (SYNC_IN) and the synchronization out signal (SYNC_OUT).

Timer B can be synchronized with Timer C, and D with timer B as master. Timer B can be synchronized with Timer A as slave.

The timer asserts the SYNC_OUT pulse when the **TBCTL.CLR** bit is set and de-asserts the SYNC_OUT pulse when the **TBCTL.CLR** bit is cleared.

Each timer C, or D that need to be synchronized as slave with master timer B need to set the **TxCTL.SYNC** bit. If this bit is not set, then the sync_in signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is asserted, the timer clears the timer counter. The timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the SYNC_IN signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. All slave timers B, C, or D are configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A, or B is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TxCTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TxCTL.CLR** signal, to assert the SYNC_OUT signal. The timers can be re-enabled by clearing the **TxCTL.CLR** bit, which de-asserts the SYNC_OUT signal.
- 6.

13.2.10. PWM/Compare Units

Timer B supports up to 4 PWM/Capture units PWMB0 to PWMB3. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TBCCxCTRL.CCMODE**.

13.2.10.1. PWM Mode

The PWM mode is enabled with setting **TBCCxCTRL.CCMODE** to 0.

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TBCTR** value of 0 and then transitions to low when **TBCTR** counts up to **TBCCxCTR** compare value.

To configure a duty cycle of 0%, the **TBCCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TBCCxCTR** value should be set to a value greater than or equal to **TBPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 13-2. PWMB0 and PWMB1 Example Using Timer B Up Mode and Up/Down Mode

13.2.10.2. Capture Mode

The Capture mode is enabled with setting **TBCCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TBCCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TBCTR** value is copied into **TBCCxCTR**.

Figure 13-3. CB0 and CB1 Capture Example

13.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TBCTL.INT** interrupt flag is set. If the interrupt is enabled using the **TBCTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TBCTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TBCCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TBCCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TBCCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TBCTL.INT** or **TBCCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

13.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer B block supports up to 1 dead time generator.

13.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGB0 can be selected using **TBCTL.DTGCLK**.

Clear **TBCTL.DTGCLK** to 0 to use clock source selected by **TBCTL.CLK** directly to use higher resolution for dead time insertion.

Set **TBCTL.DTGCLK** to 1 to use divided clock source selected by **TBCTL.CLK** and **TBCTL.CLKDIV** divider to use the same dead time resolution as Timer B.

13.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently using **DTGB0LED** and **DTGB0TED**.

13.2.12.3. Bypass Mode

Set **DTGB0CTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGB0CTL.BYPASS** to 1 to enable bypass mode, no dead time is inserted, PWMB1 is routed to DTGB0HS and PWMB0 is routed to DTGB0LS.

The DTGB0HS and DTGB0LS signals can be inverted in bypass mode.

Figure 13-4. DTGB0 Bypass Example

13.2.12.4. Inverting PWM Signal

The DTG output signals DTGB0HS and DTGB0LS can be inverted independently.

Set **DTGB0CTL.INVHS** to invert DTGB0HS signal.

Set **DTGB0CTL.INVLS** to invert DTGB0LS signal.

Figure 13-5. DTGB0 Bypass and Inverting LS Example

13.2.12.5. Dead Time Insertion

Set **DTGB0CTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWMB1 signal is used to generate DTGB0HS and DTGB0LS. PWMB0 signal is ignored and can be used for other purposes.

Set **DTGB0LED** for desired leading-edge and **DTGB0TED** for desired trailing edge in clock-cycles defined by **TBCTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGB0LS signal is automatically inverted compared to PWMB1 signal. Set **DTGB0CTL.INVLS** to 0, if this is desired behavior.

Figure 13-6. DTGB0 LED and TED Example

13.2.12.6. Dead Time Insertion with On Time Preservation

Set **DTGB0CTL.OTP** to 1 to enable on time preservation. In this mode the DTGB0HS is same as PWMB1 on time.

NOTE:

In dead time insertion mode the DTGB0LS signal is automatically inverted compared to PWMB1 signal. Set **DTGB0CTL.INVLS** to 0, if this is desired behavior.

Figure 13-7. DTGB0 LED and TED with On Time Preservation Example

13.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGB0HS, DTGB0LS outputs, and CBx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

14.2. Details of Operation

14.2.1. Block Diagram

Figure 14-1. Timer C

14.2.2. Configuration

Following blocks need to be configured for correct use of the Timer C:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer A
- Timer B
- Timer D
-

14.2.3. Timer C Block

The timer C block consist of a 16-bit timer with up mode or up/down mode with 2 PWM/capture units and 1 dead-time generator unit.

14.2.4. Timer

Once enabled the timer counts up to the Timer C period value **TCPRD**. The **TCPRD** register can be written to while the timer is running, the new **TCPRD** value will be latched when the counter reaches old **TCPRD** value in up mode. In up/down mode there is the option to latch the new **TCPRD** value when counter counts back to zero.

TCCTL.PRDL configures when the timer will be updated with the new **TCPRD** value in up/down mode. The current timer value is accessible with the timer C counter value register **TCCTR**.

14.2.5. Register update

The **TCPRD**, **TCCCxCTR** register can be written to while the timer is running, the new **TCPRD**, **TCCCxCTR** value will be latched when the counter reaches old **TCPRD** value in up mode. In up/down mode there is the option to latch the new **TCPRD**, **TCCCxCTR** values when counter counts back to zero. **TCCTL.PRDL** configures when the timer will be updated with the new **TCPRD**, **TCCCxCTR** value in up/down mode.

14.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TCCTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TCCTR** to zero use **TCCTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TCPRD**. When the timer counter reaches the value of **TCPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TCPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down

14.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TCCTL.SS** the timer will only count to **TCPRD** value and stops in up mode. In up/down mode the timer will count to **TCPRD** and back to zero only once.

To start the timer in single-shot mode, **TCCTL.SS** must be set. The timer will start when **TCCTL.CLR** is set. To re-start a single-shot timer, **TCCTL.CLR** must be reset, and then set again.

14.2.8. Input clock and Pre-scaler

The timer can be configured to use HCLK or ACLK using **TCCTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TCCTL.CLKDIV**.

14.2.9. Timer synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (SYNC_IN) and the synchronization out signal (SYNC_OUT).

Timer C can be synchronized with Timer D as master. Timer B can be synchronized with Timer A, and B as slave.

The timer asserts the SYNC_OUT pulse when the **TCCTL.CLR** bit is set and de-asserts the SYNC_OUT pulse when the **TCCTL.CLR** bit is cleared.

If timer D that need to be synchronized as slave with master timer C need to set the **TxCTL.SYNC** bit. If this bit is not set, then the sync_in signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is asserted, the timer clears the timer counter. The timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the SYNC_IN signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. The slave timer C, D is configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A, or B is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TxCTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TxCTL.CLR** signal, to assert the SYNC_OUT signal. The timers can be re-enabled by clearing the **TxCTL.CLR** bit, which de-asserts the SYNC_OUT signal.

14.2.10. PWM/Compare Units

Timer C supports up to 2 PWM/Capture units PWMC0 to PWMC1. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TCCCxCTL.CCMODE**.

14.2.10.1. PWM Mode

The PWM mode is enabled with setting **TCCCxCTRL.CCMODE** to 0.

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TCCTR** value of 0 and then transitions to low when **TCCTR** counts up to **TCCCxCTR** compare value.

To configure a duty cycle of 0%, the **TCCCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TCCCxCTR** value should be set to a value greater than or equal to **TCPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 14-2. PWM0 and PWM1 Example Using Timer C Up Mode and Up/Down Mode

14.2.10.2. Capture Mode

The Capture mode is enabled with setting **TCCCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TCCCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TCCTR** value is copied into **TCCCxCTR**.

Figure 14-3. CC0 and CC1 Capture Example

14.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TCCTL.INT** interrupt flag is set. If the interrupt is enabled using the **TCCTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TCCTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TCCCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TCCCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TCCCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TCCTL.INT** or **TCCCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

14.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer C block supports up to 1 dead time generator.

14.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGC0 can be selected using **TCCTL.DTGCLK**.

Clear **TCCTL.DTGCLK** to 0 to use clock source selected by **TCCTL.CLK** directly to use higher resolution for dead time insertion.

Set **TCCTL.DTGCLK** to 1 to use divided clock source selected by **TCCTL.CLK** and **TCCTL.CLKDIV** divider to use the same dead time resolution as Timer C.

14.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently using **DTGC0LED** and **DTGC0TED**.

14.2.12.3. Bypass Mode

Set **DTGC0CTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGC0CTL.BYPASS** to 1 to enable bypass mode, no dead time is inserted, PWM0 is routed to DTGC0HS and PWM1 is routed to DTGC0LS.

The DTGC0HS and DTGC0LS signals can be inverted in bypass mode.

Figure 14-4. DTGC0 Bypass Example

14.2.12.4. Inverting PWM Signal

The DTG output signals DTGC0HS and DTGC0LS can be inverted independently.

Set **DTGC0CTL.INVHS** to invert DTGC0HS signal.

Set **DTGC0CTL.INVLS** to invert DTGC0LS signal.

Figure 14-5. DTGC0 Bypass and Inverting LS Example

14.2.12.5. Dead Time Insertion

Set **DTGC0CTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWM1 signal is used to generate DTGC0HS and DTGC0LS. PWM0 signal is ignored and can be used for other purposes.

Set **DTGC0LED** for desired leading-edge and **DTGC0TED** for desired trailing edge in clock-cycles defined by **TCCTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGC0LS signal is automatically inverted compared to PWM1 signal. Set **DTGC0CTL.INVLS** to 0, if this is desired behavior.

Figure 14-6. DTGC0 LED and TED Example

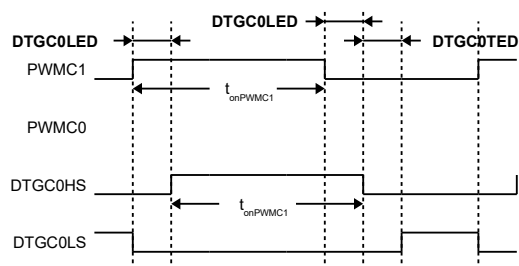

14.2.12.6. Dead Time Insertion With On Time Preservation

Set **DTGC0CTL.OTP** to 1 to enable on time preservation. In this mode the DTGC0HS is same as PWM1 on time.

NOTE:

In dead time insertion mode the DTGC0LS signal is automatically inverted compared to PWM1 signal. Set **DTGC0CTL.INVLS** to 0, if this is desired behavior.

Figure 14-7. DTGC0 LED and TED with On Time Preservation Example

14.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGC0HS, DTGC0LS outputs, and CCx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

15.2. Details of Operation

15.2.1. Block Diagram

Figure 15-1. Timer D

15.2.2. Configuration

Following blocks need to be configured for correct use of the Timer D:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer A
- Timer B
- Timer C

15.2.3. Timer D Block

The timer D block consist of a 16-bit timer with up mode or up/down mode with 2 PWM/capture units and 1 dead-time generator unit.

15.2.4. Timer

Once enabled the timer counts up to the Timer D period value **TDPRD**. The **TDPRD** register can be written to while the timer is running, the new **TDPRD** value will be latched when the counter reaches old **TDPRD** value in up mode. In up/down mode there is the option to latch the new **TDPRD** value when counter counts back to zero. **TDCTL.PRDL** configures when the timer will be updated with the new **TDPRD** value in up/down mode.

The current timer value is accessible with the timer D counter value register **TDCTR**.

15.2.5. Register Update

The **TDPRD**, **TDCCxCTR** register can be written to while the timer is running, the new **TDPRD**, **TDCCxCTR** value will be latched when the counter reaches old **TDPRD** value in up mode. In up/down mode there is the option to latch the new **TDPRD**, **TDCCxCTR** values when counter counts back to zero. **TDCTL.PRDL** configures when the timer will be updated with the new **TDPRD**, **TDCCxCTR** value in up/down mode.

15.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TDCTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TDCTR** to zero use **TDCTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TDPRD**. When the timer counter reaches the value of **TDPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TDPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down

15.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TDCTL.SS** the timer will only count to **TDPRD** value and stops in up mode. In up/down mode the timer will count to **TDPRD** and back to zero only once.

To start the timer in single-shot mode, **TDCTL.SS** must be set. The timer will start when **TDCTL.CLR** is set. To re-start a single-shot timer, **TDCTL.CLR** must be reset, and then set again.

15.2.8. Input Clock And Pre-Scaler

The timer can be configured to use HCLK or ACLK using **TDCTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TDCTL.CLKDIV**.

15.2.9. Timer Synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (**SYNC_IN**) and the synchronization out signal (**SYNC_OUT**).

Timer D can be synchronized with Timer A, B, or C as slave.

The timer asserts the **SYNC_OUT** pulse when the **TDCTL.CLR** bit is set and de-asserts the **SYNC_OUT** pulse when the **TDCTL.CLR** bit is cleared.

If timer D that need to be synchronized as slave with master timer C need to set the **TxCTL.SYNC** bit. If this is bit is not set, then the **sync_in** signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is asserted, the timer clears the timer counter. The timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the **SYNC_IN** signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. The slave timer B, C, D is configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A, B or C is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TxCTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TxCTL.CLR** signal, to assert the SYNC_OUT signal. The timers can be re-enabled by clearing the **TxCTL.CLR** bit, which de-asserts the SYNC_OUT signal.

15.2.10. PWM/Compare Units

Timer D supports up to 2 PWM/Capture units PWMD0 to PWMD1. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TDCCxCTL.CCMODE**.

15.2.10.1. PWM Mode

The PWM mode is enabled with setting **TDCCxCTRL.CCMODE** to 0.

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TDCTR** value of 0 and then transitions to low when **TDCTR** counts up to **TDCCxCTR** compare value.

To configure a duty cycle of 0%, the **TDCCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TDCCxCTR** value should be set to a value greater than or equal to **TDPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 15-2. PWMD0 and PWMD1 Example Using Timer D Up Mode and Up/Down Mode

15.2.10.2. Capture Mode

The Capture mode is enabled with setting **TDCCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TDCCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TDCTR** value is copied into **TDCCxCTR**.

Figure 15-3. CD0 and CD1 Capture Example

15.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TDCTL.INT** interrupt flag is set. If the interrupt is enabled using the **TDCTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TDCTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TDCCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TDCCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TDCCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TDCTL.INT** or **TDCCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

15.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer D block supports up to 1 dead time generator.

15.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGD0 can be selected using **TDCTL.DTGCLK**.

Clear **TDCTL.DTGCLK** to 0 to use clock source selected by **TDCTL.CLK** directly to use higher resolution for dead time insertion.

Set **TDCTL.DTGCLK** to 1 to use divided clock source selected by **TDCTL.CLK** and **TDCTL.CLKDIV** divider to use the same dead time resolution as Timer D.

15.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently using **DTGD0LED** and **DTGD0TED**.

15.2.12.3. Bypass Mode

Set **DTGD0CTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGD0CTL.BYPASS** to 1 to enable bypass mode, no dead time is inserted, PWMD1 is routed to DTGD0HS and PWMD0 is routed to DTGD0LS.

The DTGD0HS and DTGD0LS signals can be inverted in bypass mode.

Figure 15-4. DTGD0 Bypass Example

15.2.12.4. Inverting PWM Signal

The DTG output signals DTGD0HS and DTGD0LS can be inverted independently.

Set **DTGD0CTL.INVHS** to invert DTGD0HS signal.

Set **DTGD0CTL.INVLS** to invert DTGD0LS signal.

Figure 15-5. DTGD0 Bypass and Inverting LS Example

15.2.12.5. Dead Time Insertion

Set **DTGD0CTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWMD1 signal is used to generate DTGD0HS and DTGD0LS. PWMD0 signal is ignored and can be used for other purposes.

Set **DTGD0LED** for desired leading-edge and **DTGD0TED** for desired trailing edge in clock-cycles defined by **TDCTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGD0LS signal is automatically inverted compared to PWMD1 signal. Set **DTGD0CTL.INVLS** to 0, if this is desired behavior.

Figure 15-6. DTGD0 LED and TED Example

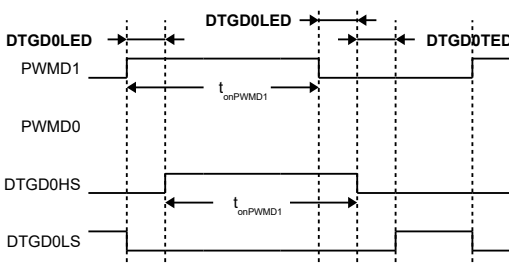

15.2.12.6. Dead Time Insertion with On Time Preservation

Set **DTGD0CTL.OTP** to 1 to enable on time preservation. In this mode the DTGD0HS is same as PWMD1 on time.

NOTE:

In dead time insertion mode the DTGD0LS signal is automatically inverted compared to PWMD1 signal. Set **DTGD0CTL.INVLS** to 0, if this is desired behavior.

Figure 15-7. DTGD0 LED and TED with On Time Preservation Example

15.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGD0HS, DTGD0LS outputs, and CDx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

Table 15-2. Timer D Signal to Pin Mapping

| PWM | CAPTURE | DEADTIME | PINS |
|-------|---------|----------|----------|
| PWMD0 | CD0 | DTGD0LS | PA5, PD7 |
| PWMD1 | CD1 | DTGD1LS | PD4 |

16.2. Details of Operation

16.2.1. Block Diagram

Figure 16-1. FLASH Memory Controller

16.2.2. Configuration

Following blocks need to be configured for correct use of the FLASH:

- Clock Control System (CCS)

16.2.3. FLASH Memory

The Flash memory controller allows configuration of the FLASH memory. FLASH wait states, FLASH erase, buffered FLASH write, and SWD debug access can be configured. The FLASH memory has up to 32 pages of 1kByte each.

16.2.4. Writing to FLASH Controller Registers

The FLASH Controller registers are write protected to reduce chances of accidental erase or modification of FLASH memory. Each write to a FLASH controller register is a 2 step process. The first step is to write the correct key into **FLASHLOCK** followed by a FLASH controller register write.

Without correct key any writes to FLASH controller register will be ignored. Flash controller reads are always possible.

16.2.5. FLASH Wait State

After device reset, the **FLASHWSTATE** is set to 0x3. To allow optimal FLASH access time without delay, the FLASH wait state need to be set according to HCLK frequency used. See register table for correct setting.

To write to **FLASHWSTATE** register, **FLASHLOCK** need to be set to 0x1234 5678.

16.2.6. FLASH Page Erase

To erase a page of FLASH memory, set **FLASHLOCK** to 0xAAAA AAAA first, then set **FLASHBWDATA.PAGE** to the page to be erased and then set **FLASHPERASE** to 0xA5A5 5A5A. The FLASH page operation will start, **FLASHCTL.PERASE** is set to 1b and any access to FLASH memory address space is stalled until erase operation is finished. **FLASHCTL.PERASE** is set to 0b when erase operation is finished.

It is not recommended to erase FLASH pages while executing from FLASH as any access to FLASH is stalled until the erase operation is finished. Either execute from SRAM or use SWD debug interface.

16.2.7. Write to FLASH

Only half-word address aligned half-word writes are supported. To write a half word to FLASH memory, make sure the memory location is erased by doing a read, it should return 0xFFFF. Set **FLASHLOCK** to 0xAAAA AAAA first, then write a half-word to the memory address directly.

It is not recommended to write to FLASH while executing from FLASH as any access to FLASH is stalled until the erase operation is finished. Either execute from SRAM or use SWD debug interface.

16.2.8. Buffered Write to FLASH

Only half-word address aligned half-word writes are supported. The FLASH memory controller also allows buffered write to FLASH, to allow CPU still react to interrupts or perform other tasks while waiting for FLASH write to finish when executing from SRAM.

To write a half word to FLASH memory, make sure the memory location is erased by doing a read, it should return 0xFFFF. Set **FLASHLOCK** to 0xAAAA AAAA first, then write to **FLASHBWDATA**, with **FLASHBWDATA.DATA** the half-word you want to write, and **FLASHBWDATA.PAGE** the page where the memory location resides and **FLASHBWDATA.ADDRESS** the relative address of the memory location.

The FLASH page operation will start, **FLASHCTL.WRITE** is set to 1b, AHB bus control will be given back to CPU to allow execution of other commands. Any access to FLASH memory while buffered write operation is active will stall. **FLASHCTL.WRITE** is set to 0b when buffered write operation is finished.

To calculate **FLASHBWDATA.PAGE** use:

$$PAGE = \frac{Memoryaddress}{pagesize} \quad (4)$$

Where:

PAGE: integer value for **FLASHBWDATA.PAGE**

Memoryaddress: Word memory address

pagesize: FLASH page size: 0x400

Then to calculate **FLASHBWDATA.ADDRESS** use:

$$ADDRESS = \frac{(Memoryaddress - PAGE * pagesize)}{2} \quad (5)$$

Where:

ADDRESS: integer value for **FLASHBWDATA.ADRRESS**

PAGE: integer value for **FLASHBWDATA.PAGE**

Memoryaddress: Word memory address
pagesize: FLASH page size: 0x400

Example:

memoryaddress: 0x0000 0438

PAGE = 0x0000 0438 / 0x400 = 0x01

ADDRESS = (0x0000 0438 – 0x01*0x400)/0x2 = 0x38/0x2 = 0x1C

It is not recommended to write to FLASH while executing from FLASH as any access to FLASH is stalled until the erase operation is finished. Either execute from SRAM or use SWD debug interface.

16.2.9. SWD Debug Access Disable

The SWD debug access is enabled by default and can be disabled by a FUSE to prevent access of device memory.

Caution need to be taken. This action is not reversible.

To disable SWD set **FLASHLOCK** to 0xF983 62AB first, then write 0x6969 6969 to address 0x0010 0008 will disable the SWD debug access.

17.1.2. EMUXCTL

Register 17-1. EMUXCTL (ADC external MUX control register 0x4015 0000)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:6 | Reserved | R | 0x0 | Reserved |
| 5 | EMUXC | RW | 0x0 | ADC external MUX control 1b: EMUX is controlled by auto-sequencer unit 0b: EMUX manual control |
| 4 | EMUXBUSY | RW | 0x0 | ADC external MUX status 1b: ADC external MUX sending data 0b: ADC external MUX not busy or not used |
| 3 | EMUXDONE | RW | 0x0 | ADC external MUX data send done, auto-clear with read or when new data is sent over EMUX 1b: ADC external MUX data sent 0b: ADC external MUX busy |
| 2:0 | EMUXCDIV | RW | 0x0 | ADC external mux clock to FCLK divider 111b: FCLK/8 110b: FCLK/7 101b: FCLK/6 100b: FCLK/5 011b: FCLK/4 010b: FCLK/3 001b: FCLK/2 000b: FCLK/1 |

17.1.3. EMUXDATA

Register 17-2. EMUXDATA (EMUX data register 0x4015 0004)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | DATA | RW | 0x0 | EMUX data, writing this register will start transmission over EMUX |

17.1.4. ADCCTL

Register 17-3. ADCCTL (ADC control register 0x4015 0008)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|------------------|--------|-------|---|
| 31:16 | Reserved | R | 0x0 | Reserved |
| 15 | ADCEN | RW | 0x0 | ADC module enable 1b: enable ADC module 0b: turn off ADC module |
| 14 | ADCSTART | R/W | 0x0 | Start ADC conversion. A write of 1b will start ADC conversion if ADCCTL.ADCBUSY = 0b and ADCCTL.ADCMODE = 00b. 1b: start ADC conversion 0b: stop ADC conversion, also stop repeated ADC conversions ADCCTL.ADCREPEAT = 1b. |
| 13 | ADCREPEAT | R/W | 0x0 | ADC repeat mode 1b: repeated conversion, also auto rearms auto sequencer 0b: single shot conversion |
| 12:10 | ADCMODE | R/W | 0x0 | ADC conversion mode 111b: automated sequencer 0 and 1 independently triggered 110b: automated sequencer 0 and 1 daisy chained trigger on AS0 101b: automated sequencer 1 only trigger condition 100b: automated sequencer 0 only trigger condition 011b: automated sequencer 0 and 1 daisy chained 010b: automated sequencer 1 only 001b: automated sequencer 0 only 000b: single channel |
| 9:8 | Reserved | R | 0x0 | Reserved |
| 7 | ADCBUSY | R | 0x0 | ADC busy 1b: ADC conversion or auto sequencer active 0b: ADC no operation |
| 6:4 | ADCMUX | R/W | 0x0 | ADC MUX input select 111b: VSSA 110b: reserved 101b: AD5 100b: AD4 011b: AD3 010b: AD2 001b: AD1 000b: AD0 |
| 3 | DONE | R | 0x0 | ADC Conversion Complete 0b: not complete 1b: complete |
| 2:0 | ADCCDIV | R/W | 0x0 | ADC input clock FCLK divider 111b: FCLK/8 110b: FCLK/7 101b: FCLK/6 100b: FCLK/5 011b: FCLK/4 010b: FCLK/3 001b: FCLK/2 000b: FCLK/1 |

17.1.5. ADCCR

Register 17-4. ADCCR (ADC conversion result register 0x4015 000C)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|-------------|
| 31:10 | Reserved | R | 0x0 | Reserved |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-----------------|--------|-------|-----------------------|
| 9:0 | ADCRESLT | R | 0x0 | ADC conversion result |

17.1.6. ADCINT

Register 17-5. ADCINT (ADC Interrupt register 0x4015 0010)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-------------------|--------|-------|--|
| 31:13 | Reserved | R | 0x0 | Reserved |
| 19:18 | ASCINTSEQ | RW | 0x0 | Last Auto sequencer to trigger ADCINT.ASCINT 11b: Auto sequencer 1 and 0 triggered interrupt 10b: Auto sequencer 1 triggered interrupt 01b: Auto sequencer 0 triggered interrupt 00b: no trigger |
| 17:16 | ASCINTTR | RW | 0x0 | Last Auto sequencer to run 11b: reserved 10b: auto sequencer 1 to run 01b: auto sequencer 0 to run 00b: no sequencer to r |
| 15:13 | Reserved | R | 0x0 | Reserved |
| 12 | ASCINT_EN | RW | 0x0 | Enable auto sequencer collision interrupt 1b: enable ASCINT 0b: disable ASCINT |
| 11 | AS1INT_EN | RW | 0x0 | Enable auto sequencer 1 conversions finished interrupt 1b: enable AS1INT 0b: disable AS1INT |
| 10 | AS0INT_EN | RW | 0x0 | Enable auto sequencer 0 conversions finished interrupt 1b: enable AS0INT 0b: disable AS0INT |
| 9 | EMUXINT_EN | RW | 0x0 | Enable EMUX transfer finished interrupt 1b: enable EMUXINT 0b: disable EMUXINT |
| 8 | ADCINT_EN | RW | 0x0 | Enable ADC conversion finished interrupt 1b: enable ADCINT 0b: disable ADCINT |
| 7:5 | Reserved | RW | 0x0 | Reserved, must be set to 0 |
| 4 | ASCINT | RW | 0x0 | Auto sequencer collision interrupt 1b: interrupt, clear by writing 1b to it 0b: no interrupt NOTE: This bit is cleared by writing a 1b to it. |
| 3 | AS1INT | RW | 0x0 | Auto sequencer 1 conversions finished interrupt 1b: interrupt, clear by writing 1b to it 0b: no interrupt NOTE: This bit is cleared by writing a 1b to it. |
| 2 | AS0INT | RW | 0x0 | Auto sequencer 0 conversions finished interrupt 1b: interrupt, clear by writing 1b to it 0b: no interrupt NOTE: This bit is cleared by writing a 1b to it. |
| 1 | EMUXINT | RW | 0x0 | EMUX data transfer finished interrupt 1b: interrupt, clear by writing 1b to it 0b: no interrupt NOTE: This bit is cleared by writing a 1b to it. |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|---------------|--------|-------|---|
| 0 | ADCINT | RW | 0x0 | ADC conversion finished interrupt 1b: interrupt, clear by writing 1b to it 0b: no interrupt NOTE: This bit is cleared by writing a 1b to it. |

17.1.7. AS0CTL

Register 17-6. AS0CTL (Auto Sequencer 0 control register 0x4015 0040)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|---|
| 31:13 | Reserved | R | 0x0 | Reserved |
| 12 | AS0BUSY | RW | 0x0 | Auto sequencer 0 busy 1b: auto sequencer 0 sampling active 0b: auto sequencer 0 not active |
| 11 | AS0EN | RW | 0x0 | Auto sequencer 0 enable 1b: auto sequencer 0 enabled 0b: auto sequencer 0 not enabled |
| 10:8 | AS0D | RW | 0x0 | Auto sequencer 0 sampling depth 111b: 8 samples 110b: 7 samples 101b: 6 samples 100b: 5 samples 011b: 4 samples 010b: 3 samples 001b: 2 samples 000b: 1 sample |
| 7 | AS0TR | RW | 0x0 | Auto sequencer 0 trigger source 1b: Timer, as defined by AS0CTL.AS0TRTMR 0b: PWM, as defined by AS0CTL.AS0TRPWM |
| 6 | AS0TRE | RW | 0x0 | Auto sequencer 0 trigger source AS0CTL.AS0TR edge 1b: high to low edge 0b: low to high edge |
| 5:4 | AS0TRTMR | RW | 0x0 | Auto sequencer 0 timer trigger source 11b: Timer D 10b: Timer C 01b: Timer B 00b: Timer A |
| 3:0 | AS0TRPWM | RW | 0x0 | Auto sequencer 0 PWM trigger source 1111b: reserved 1110b: reserved 1101b: PWMD1 1100b: PWMD0 1011b: PWMC1 1010b: PWMC0 1001b: PWMB1 1000b: PWMB0 0111b: PWMA7 0110b: PWMA6 0101b: PWMA5 0100b: PWMA4 0011b: PWMA3 0010b: PWMA2 0001b: PWMA1 0000b: PWMA0 |

17.1.8. AS0S0

Register 17-7. AS0S0 (Auto sequencer 0-sample 0 control 0x4015 0044)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|--|
| 31:15 | Reserved | R | 0x0 | Reserved |
| 14:12 | ADCMUX | RW | 0x0 | ADC MUX input select 111b: VSSA 110b: reserved 101b: AD5 100b: AD4 011b: AD3 010b: AD2 001b: reserved 000b: EMUX |
| 11:10 | DELAY | RW | 0x0 | Delay between start of sample sequence and start of ADC conversion in ADC input clocks FLCK/ADCCTL.ADCCDIV 11b: 16 ADC input clock cycles 10b: 8 ADC input clock cycles 01b: 4 ADC input clock cycles 00b: 0 ADC input clock |
| 9:8 | EMUXS | RW | 0x0 | EMUX transmission start 11b: reserved 10b: send AS0S0.EMUXD data after S/H of ADC 01b: send AS0S0.EMUXD data at beginning of this sample sequence 00b: do not send AS0S0.EMUXD data |
| 7:0 | EMUXD | RW | 0x0 | EMUX data to transmit |

17.1.9. AS0R0

Register 17-8. AS0R0 (Auto sequencer 0-sample 0 result register 0x4015 0048)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|-----------------------|

17.2. Details of Operation

17.2.1. Block Diagram

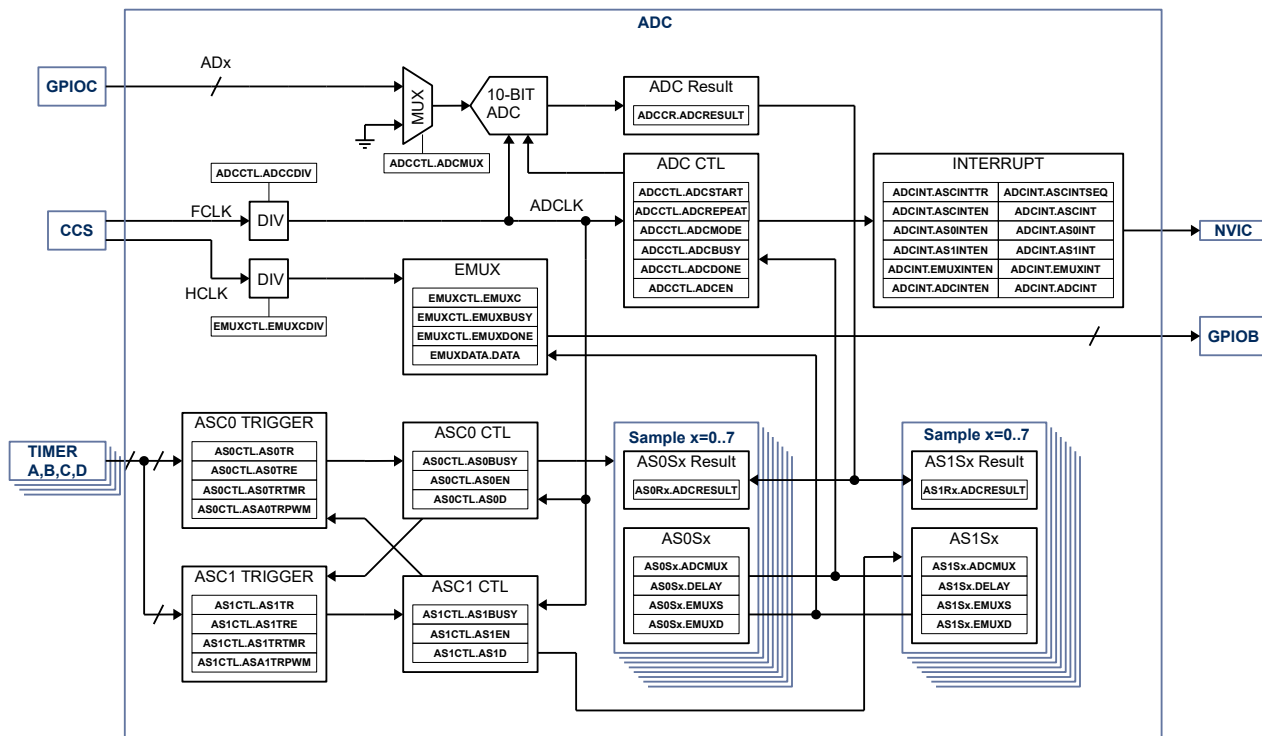

17.3. Details of Operation

17.3.1. Basic Configuration

Following blocks need to be configured for correct operation of the ADC

- CCS
- Timer A, B, C or D
- GPIOB
- GPIOC

Figure 17-1. ADC, EMUX, ASC0, ASC1

- NVIC

17.3.2. ADC, Autosequencer and EMUX

The ADC is a 10-bit SAR ADC. It can be used standalone or together with up to 2 independent low latency auto sequencer state machines to take series of up to 8 samples each into dedicated sample result registers, triggered by either PWM or timer signals. Each sample setup can be programmed with dedicated ADC-MUX setting and settling time delay. A dedicated, programmable high speed low latency communication interface is available to set analog both MUX, sample and hold circuits in the analog peripherals.

17.3.3. Clock Setting

The ADC clock is derived from FCLK and can be set with **ADCCTL.ADCCDIV**. The ADC clock should not exceed 16MHz for correct operation.

The EMUX clock is derived from HCLK and can be set with **EMUXCTL.EMUXCDIV**.

17.3.4. ADC

The ADC, ASC0, ASC1 and EMUX block is enabled with **ADCCTL.ADCEN**. In manual conversion mode set **ADCCTL.ADCMODE** to 0b. Set the ADx channel with **ADCCTL.ADCMUX**. For single conversion, set **ADCCTL.REPEAT** to 0b, for repeated conversion set **ADCCTL.REPEAT** to 1b. To start a conversion set **ADCCTL.ADCSTART** to 1b. The ADC will start sampling the analog input channel for 3 clock cycles and holds the analog value in it's internal S/H for conversion. It is safe to switch ADC input channel 4 clocks after ADC start without affecting the ADC result.

One complete ADC conversion will take 16 ADC clock cycles and the ADC conversion result will be available in **ADCCR**. In repeated mode **ADCCR** will be overwritten every 16 ADC clock cycles.. The **ADCCTL.ADCBUSY** flag will 1b as long as conversions are active. **ADCCTL.ADCSTART** will auto clear in single conversion mode. To stop a conversion manually clear **ADCCTL.ADCSTART**.

Figure 17-2. ADC Conversion (Single Shot)

Figure 17-3. ADC Conversion (Repeat Mode)

17.3.5. EMUX

The EMUX is a low latency high speed serial interface with 8-bit data message to control the external ADC MUX and S/H in the analog front end. The EMUX interface is independent from the SOC BUS bridge.

The clock frequency of the EMUX can be adjusted with **EMUXCTL.EMUXCDIV** from HCLK/1 to HCLK/8.

To allow use of EMUX with auto sequencer ASC0 and ASC1, **EMUXCTL.EMUXC** must be set to 1b.

In manual mode with **EMUXCTL.EMUXC** = 0b, the EMUX will start sending the message MSB first as soon as a 8-bit message is written to **EMUXDATA**. While the message is transferred, **EMUXCTL.EMUXDONE** is cleared and is set to 1b when the message transfer is complete.

17.3.6. Auto Sequencer ASC0, ASC1

The ADC and EMUX can be controlled with 2 independent auto sequencer state machines ASC0 and ASC01 to

offload the CPU from high speed, low latency sampling. Each sequencer can be programmed to take up to 8 consecutive ADC samples from different analog inputs.

17.3.6.1. Auto Sequencer Modes

The AC0, ASC1 support 8 different modes, configurable with **ADCCTL.ADCMODE**.

With **ADCCTL.ADCMODE** = 000b ASC0 and ASC1 are disabled and the ADC is used in manual mode.

With **ADCCTL.ADCMODE** = 001b only ASC0 is active and manually triggered with **AS0CTL.AS0EN**.

With **ADCCTL.ADCMODE** = 010b only ASC1 is enabled and manually triggered with **AS1CTL.AS1EN**.

With **ADCCTL.ADCMODE** = 011b ASC0 and ASC1 are enabled and daisy chained. When manually triggered with **AS0CTL.AS0EN**. ASC0 will convert all programmed samples, when finished ASC0 will automatically trigger ASC1.

With **ADCCTL.ADCMODE** = 100b only ASC0 is active and triggered with trigger source configured in **AS0CTL.AS0TR**.

With **ADCCTL.ADCMODE** = 101b only ASC1 is active and triggered with trigger source configured in **AS1CTL.AS1TR**.

With **ADCCTL.ADCMODE** = 110b ASC0 and ASC1 are enabled and daisy chained. When triggered with source defined in **AS0CTL.AS0TR**, ASC0 will convert all programmed samples, when finished ASC0 will automatically trigger ASC1.

With **ADCCTL.ADCMODE** = 111b ASC0 and ASC1 are enabled and run independently. ASC0 is triggered with **AS0CTL.AS0TR**, ASC1 is triggered with **AS1CTL.AS1TR**.

Figure 17-4. ASCx, ADCCTL.ADCMODE = 001b, 010b, 100b, 101b

Figure 17-5. ASCx, ADCCTL.ADCMODE = 011b, 110b

Figure 17-6. ASCx, ADCCTL.ADCMODE = 111b

17.3.6.2. Sequencer trigger

Each sequencer ASC0 and ASC1 can use 2 different trigger modes, manual mode or automated mode.

In automated mode use **ASxCTL.ASxTR** to set the trigger source either to timer A, B, C, or D or PWMAx, PWMBx, PWMCx or PWMDx. Use **AS0xCTL.ASxTRE** to set rising or falling edge trigger. Use **AS0xCTL.ASxTMR** to select timer source or **AS0xCTL.ASxTRPWM** to PWM source.

17.3.6.3. ASC Samples

Each sequencer can be programmed to take 1 to 8 samples up on triggering using **ASxCTL.ASxD**. For each sample, the ADC channel can be programmed with **ASxSy.ADCMUX**, a delay between MUX change and ADC start using **ASxSy.DELAY**, a EMUX message to be send with **ASxSy.EMUXD**, and a configuration with **ASxSy.EMUXS** to not send EMUXD, send right after ADCMUX change or send right after start of delay.

NOTE:

Make sure that the EMUX transmission is finished within delay time or ADC conversion time by choosing the correct EMUX clock divider setting.

Figure 17-7. ASxSy Sample with ASxSy.EMUXS = 00b and ASxSy.DELAY = 11b

Figure 17-8. ASxSy Sample with ASxSy.EMUXS = 01b and ASxSy.DELAY = 11b

Figure 17-9. ASxSy Sample with ASxSy.EMUXS = 10b and ASxSy.DELAY = 11b

17.3.6.4. ASC0, ASC1 Priority and Collision

In **ADCCTL.ADCMODE** = 100b, 101b, 110b the ASC are triggered with external trigger timer or PWM. Care has to be taken to space the trigger wide enough to allow sequencer ASCx to finish all samples. In case the sequencer trigger event happens before ASC sequencer finishes all samples, the **ADCINT.ASCINT** collision interrupt will be set and the trigger will be ignored. When **ADCINT.ASCINT** is set, **ADCINT.ASCINTSEQ** shows the ASC0 or ASC1 trigger causing the collision interrupt and **ADCINT.ASCINTR** the actual running sequencer.

Figure 17-10. ASCx, 8 samples, No Collision

Figure 17-11. ASCx 8 samples, Collision

In **ADCCTL.ADCMODE** = 111b, the ASC0 and ASC1 sequencer are triggered independently but are accessing the same ADC.

In case of both ASC0 and ASC1 are triggered at the same time, ASC0 has always higher priority and will be executed while ASC1 is skipped and ignored. **ADCINT.ASCINT** will be set, **ADCINT.ASCINTSEQ** shows the ASC0 or ASC1 trigger causing the collision interrupt and **ADCINT.ASCINTR** the actual running sequencer.

In case of ASC0 or ASC1 sequencer running while the other is triggered, the second sequencer trigger is skipped and ignored, **ADCINT.ASCINT** will be set, **ADCINT.ASCINTSEQ** shows the ASC0 or ASC1 trigger causing the collision interrupt and **ADCINT.ASCINTR** the actual running sequencer.

Figure 17-12. ASC0 8 samples, ASC1 4 samples, Collision

| 8 | I2CMARXDATAF | R | 0x0 | I2CMARXDATA full 1b: I2CMARXDATA register full, clear by read 0b: I2CMARXDATA register empty |
| 7:0 | MARXDATA | RW | 0x0 | Master Data Byte received |

18.1.7. I2CMTXDATA

Register 18-6. I2CMTXDATA (I²C Master Transmit Data, 0x401B 0038)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|--------------|--------|-------|---|
| 31:9 | Reserved | RW | 0x0 | Reserved |
| 9 | LBYTE | RW | 0x0 | Last Byte of Transfer 1b: Last byte of READ or WRITE indicator, initiate STOP after data transfer |
| 8 | I2CMATXDATAF | R | 0x0 | I2CMATXDATA full 1b: I2CMATXDATA register full, data not transmitted 0b: I2CMATXDATA register empty |
| 7:0 | MATXDATA | RW | 0x0 | Master Data Byte to transmit |

18.1.8. I2CBAUD

Register 18-7. I2CBAUD (I²C Baud Rate, 0x401B 0040)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|----------|--------|-------|---|
| 31:27 | Reserved | R | 0x0 | Reserved |
| 26:16 | SCLH | RW | 0x1EC | Number of HCLK cycles for I2CCL high time |
| 15:11 | Reserved | R | 0x0 | Reserved |
| 10:0 | SCLL | RW | 0x1EC | Number of HCLK cycles for I2CCL low time |

18.1.9. I2CSLRXDATA

Register 18-8. I2CSLRXDATA (I²C Slave Receive Data, 0x401B 0070)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|--------------|--------|-------|---|
| 31:9 | Reserved | RW | 0x0 | Reserved |
| 8 | I2CSLRXDATAF | R | 0x0 | I2CSLRXDATA full 1b: I2CSLRXDATA register full, data not transmitted 0b: I2CSLRXDATA register empty |
| 7:0 | SLRXDATA | RW | 0x0 | Slave Data Byte received |

18.1.10. I2CSLTXDATA

Register 18-9. I2CSLTXDATA (I²C Slave Transmit Data, 0x401B 0074)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|---------------------|--------|-------|---|
| 31:9 | Reserved | RW | 0x0 | Reserved |
| 9 | I2CSLTXDATAF | R | 0x0 | I2CSLTXDATA full 1b: I2CSLTXDATA register full, data not transmitted 0b: I2CSLTXDATA register empty |
| 8 | NACK | RW | 0x0 | Slave ACK or NACK 1b: Issue NACK on I ² C Write 0b: Issue ACK on I ² C Write |
| 7:0 | SLTXDATA | RW | 0x0 | Slave Data Byte to transmit |

18.1.11. I2CADDR

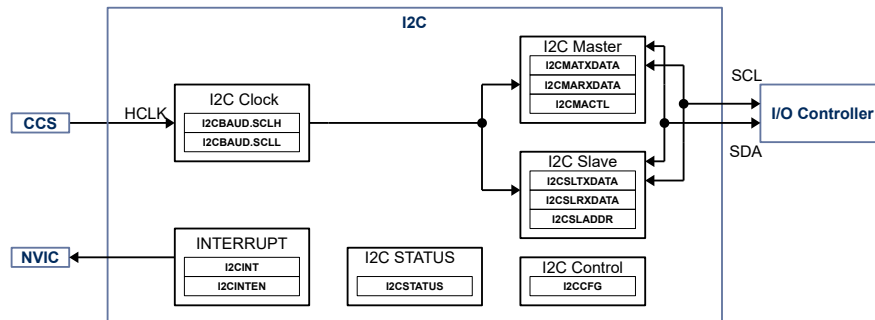

Register 18-10. I2CADDR (I²C Slave Address, 0x401B 0074)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|------------------------------|
| 31:10 | Reserved | RW | 0x0 | Reserved |
| 9:7 | SLADDRH | R | 0x0 | Higher Slave address bit 9:7 |
| 6:0 | SLADDRL | RW | 0x0 | Lower Slave address bit 6:0 |

18.2. Details of Operation

18.2.1. Block Diagram

Figure 18-1. I2C

18.2.2. Configuration

Following blocks need to be configured for correct use of the I2C:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller

18.2.3. I2C

The I2C Controller has one master and one slave connected to the same I/O that can be configured to be master only, slave only or concurrent master/slave. The I2C controller supports Normal mode (100kHz), Fast mode (400kHz), and Fast Mode+ (1MHz) operation as well as either 7-bit or 10-bit addressing.

The master supports both single master and multi-master, multi-master sync and multi-master arbitration. The slave supports clock stretching as well.

18.2.4. I2C Clock setting

The I2C SCLK frequency is derived from HCLK, **I2CBAUD.SCLH** sets the SCLK high pulse and **I2CBAUD.SCLL** sets the SCLK low pulse in HCLK cycles and need to be set correctly for different I2C mode.

The minimum HCLK for correct function of the I2C block is: 2.8MHz for normal mode, 3.2MHz for fast mode and 6.14MHz for fast+ mode.

The table below shows pre-calculated **I2CBAUD** settings for normal, fast and fast+ mode with 50MHz HCLK.

Table 18-11. I2CBAUD settings for different HCLK

| I2C Mode | SCLK Frequency | HLCK | I2CBAUD.SCLH | I2CBAUD.SCLL |
|----------|----------------|---------|--------------|--------------|
| Normal | 100kHz | 50MHz | 0xFA | 0xFA |
| Normal | 100kHz | 4MHz | 0x14 | 0x14 |
| Normal | 100kHz | 2.8MHz | 0x0E | 0x0E |
| Fast | 400kHz | 50MHz | 0x3E | 0x3E |
| Fast | 400kHz | 4MHz | 0x3E | 0x3E |
| Fast | 400kHz | 3.2MHz | 0x04 | 0x04 |
| Fast+ | 1000kHz | 50MHz | 0x18 | 0x18 |
| Fast+ | 1000kHz | 6.14MHz | 0x03 | 0x03 |

18.2.5. I2C Addressing

The I2C address for I2C master is set in **I2CMCTRL.I2CADDRL** and **I2CMCTRL.I2CADDRH**. The slave address is set **I2CADDR.SLADDRL** and **I2CADDR.SLADDRH**.

18.2.6. I2C Master Read Transactions

The diagram below shows an example of an I2C master read, including which interrupts occur for firmware processing of this transaction.

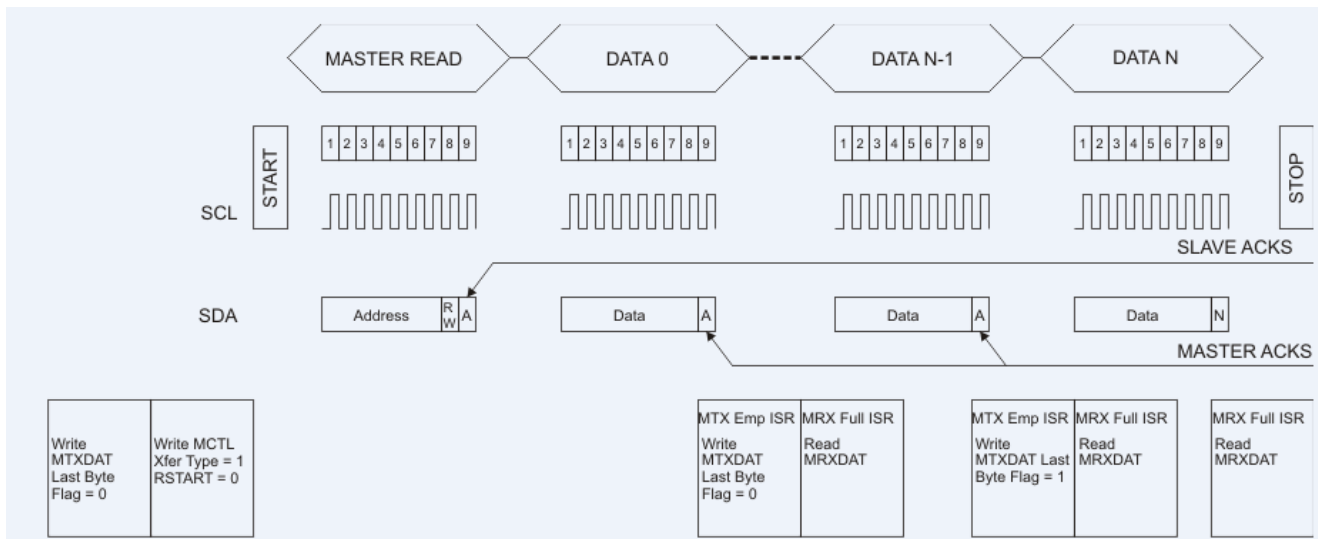

Figure 18-2. I2C Master Read Transaction

A Master Read is initiated when you write to the **I2CMTXDATA** and **I2CMCTRL** register. They need to be written in this order: **I2CMTXDATA** first, then **I2CMCTRL**.

- On the last byte of the transaction, write **MTXDATA** bit 0 to a zero. This tells the system to wait for an ACK from the slave.
- Write **I2CMCTRL** and set **XFERTYPE** to 1 (I2C Master Read), **RSTART** to the desired value (0: No STOP, 1: STOP) and the slave address in **I2CADDRU** and **I2CADDRL**.

- Once **I2CMCTRL** is written, the I2C transfer will begin.

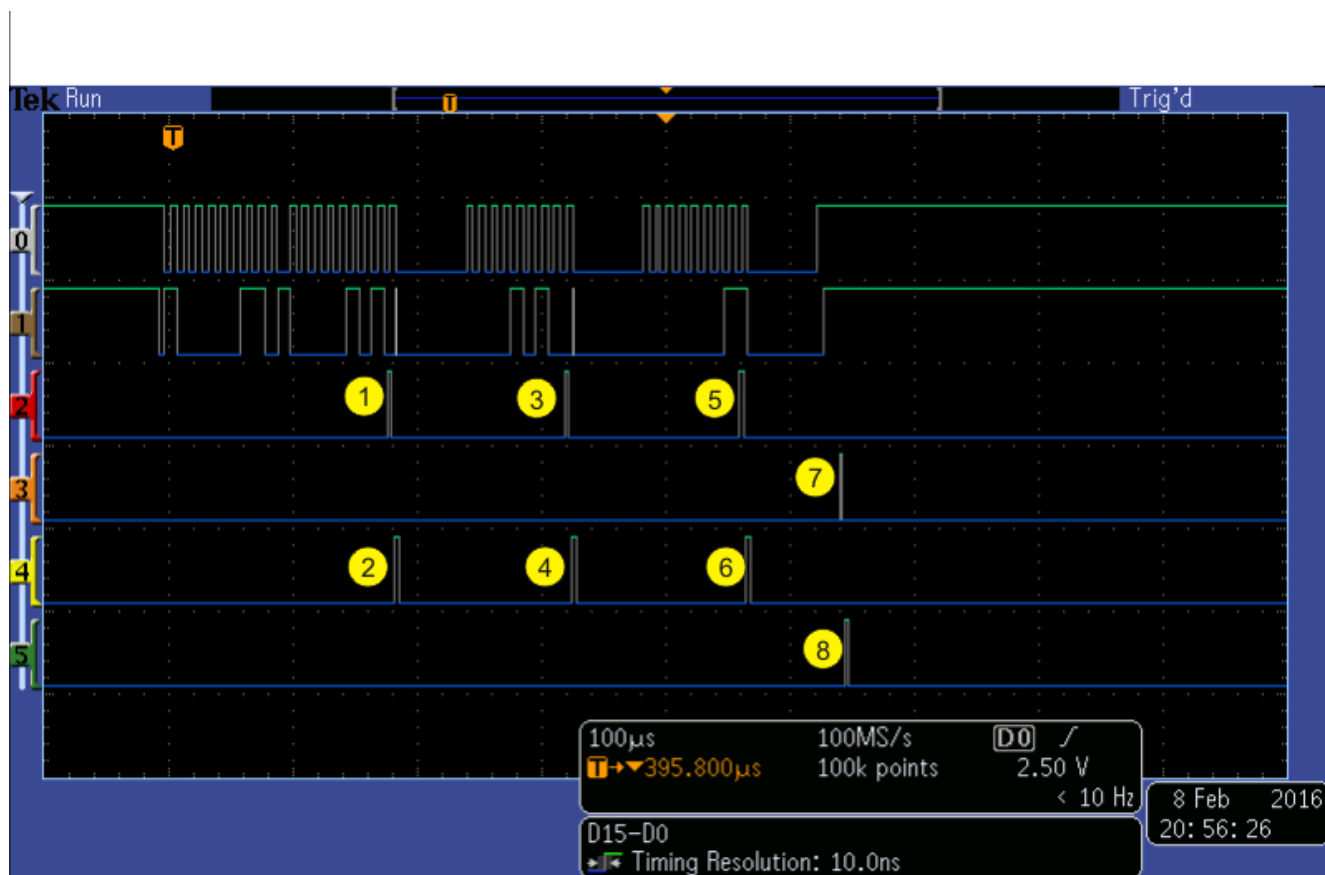

The Master will send the first byte with the slave address and the Read command. The slave will ACK. Immediately after this first ACK, the master will request the first data byte.

When the first data byte is transferred into the Master, the Master will ACK and generate two interrupts: one for Master Transmit Data Register Empty and then one for Master Receive Data Register Full.

- Upon **I2CSTATUS.MTXE** interrupt (master transmit empty), the firmware must write a 1 to the **I2CMTXDATA.LBYTE** flag if there are more than one data byte pending to be received, or a 0 to the **I2CMTXDATA.LBYTE** if the next byte to be received is the last.
- Upon the **I2CSTATUS.MRXF** interrupt (master receive full), the firmware must read the **I2CMRXDATA** register.

Next, repeat until the N-1 data byte is received. On this byte, the firmware must write a 1 to the **I2CMTXDATA.LBYTE**. On the last byte received, the **I2CMTXDATA** must not be written. The **I2CMRXDATA** register still needs to be read.

The waveforms will be similar to the figure below.

PAC52xx Master Read Packet Structure

Figure 18-3. I2C Master Read Waveforms

1. First Data Byte **I2CSTATUS.MATXE** interrupt, **I2CMTXDATA.LBYTE** = 0
2. First Data Byte **I2CSTATUS.MRXF** interrupt, read the **I2CMTXDATA** register
3. Second Data Byte **I2CSTATUS.MATXE** interrupt, **I2CMTXDATA.LBYTE** = 1 (as byte #3 will be NACK'd)
4. Second Data Byte **I2CSTATUS.MRXF** interrupt, read the **I2CMTXDATA** register
5. Third Data Byte **I2CSTATUS.MATXE** interrupt, do not write to the **I2CMTXDATA** register
6. Third Data Byte **I2CSTATUS.MRXF** interrupt, read the **I2CMTXDATA** register
7. **I2CMCTRL** Access Register Accessed – can be used for multi-packet communication management.
8. Master Transfer Complete – A STOP has been issued

19. UART

19.1. Register

19.1.1. Register Map

Table 19-1. UART Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|-------------|------------------|---|-------------|
| UART | | | |
| 0x401D 0000 | UARTRTX | UART receive/transmit FIFO (available only if UARTLCR.DLAB = 0b) | 0x0000 0000 |
| | UARTDL_L | UART divisor latch low (available only if UARTLCR.DLAB = 1b) | |
| 0x401D 0004 | UARTIER | UART interrupt enable (available only if UARTLCR.DLAB = 0b) | 0x0000 0000 |
| | UARTDL_H | UART divisor latch high (available only if UARTLCR.DLAB = 1b) | |
| 0x401D 0008 | UARTIIR | UART interrupt identification (only for register read) | 0x0000 0001 |
| | UARTFCTL | UART FIFO control (only for register write) | |
| 0x401D 000C | UARTLCR | UART line control | 0x0000 0000 |
| 0x401D 0010 | UARTMCR | UART modem control | 0x0000 0000 |
| 0x401D 0014 | UARTLSR | UART line status | 0x0000 0060 |
| 0x401D 0018 | UARTMSR | UART modem status | 0x0000 0000 |

| 0x401D 002C | UARTDL_H2 | UART divisor latch high byte | 0x0000 0000 |
| 0x401D 0038 | UARTFD_F | UART fractional divisor value | 0x0000 0000 |
| 0x401D 003C | Reserved | Reserved | 0x0000 0000 |
| 0x401D 0040 | UARTSTAT | UART FIFO status | 0x0000 0005 |

19.1.2. UARTRTX

Register 19-1. UARTRTX (UART Receive/Transmit FIFO, 0x401D 0000)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | Receive and Transmit FIFO buffer on READ: RX FIFO on WRITE: TX FIFO |

The **UARTRTX** register is available when **UARTLCR.DLAB** = 0b.

During a read of **UARTRTX.VAL**, the head of the FIFO is read. During a write of **UARTRTX.VAL**, the tail of the FIFO is written with the new data.

19.1.3. UARTDL_L

Register 19-2. UARTDL_L (UART Divisor Latch (low byte), 0x401D 0000)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--------------------------|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | Divisor value, low byte. |

The **UARTDL_L** register is available when **UARTLCR.DLAB** = 1b.

This register allows the user to read or write the low byte of the divisor latch.

19.1.4. UARTIER

Register 19-3. UARTIER (UART Interrupt Enable, 0x401D 0004)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:4 | Reserved | R | 0x0 | Reserved |
| 3 | MSI | RW | 0x0 | Modem Status interrupt enable 1b: enable interrupt 0b: disable interrupt |
| 2 | RLSI | RW | 0x0 | Receive interrupt enable 1b: enable interrupt 0b: disable interrupt |
| 1 | THREI | RW | 0x0 | TX register empty interrupt enable 1b: enable interrupt 0b: disable interrupt |
| 0 | RDAI | RW | 0x0 | RX register data available interrupt enable 1b: enable interrupt 0b: disable interrupt |

The **UARTIER** register is available when **UARTLCR.DLAB** = 0b.

This register allows the user to set the interrupt enable status of the different status conditions of the UART (modem status, receive status, TX register empty and RX register empty).

19.1.5. UARTDL_H

Register 19-4. UARTDL_H (UART Divisor Latch (high byte), 0x401D 0004)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---------------------------|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | Divisor value, high byte. |

The **UARTDL_H** register is available when **UARTLCR.DLAB** = 1b. This register allows the user to read or write the high byte of the divisor latch.

19.1.6. UARTIIR

Register 19-5. UARTIIR (UART Interrupt Identification, 0x401D 0008)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7 | RXFEN | R | 0x0 | RX FIFO enable flag 1b: enabled 0b: disabled |
| 6 | TXFEN | R | 0x0 | TX FIFO enable flag 1b: enabled 0b: disabled |
| 5:4 | Reserved | R | 0x0 | Reserved |
| 3:1 | IID | R | 0x0 | UART Interrupt type 111b: reserved 110b: Timeout 101b: reserved 100b: reserved 011b: RX Line Status 010b: RX Data Available 001b: TX Hold register empty 000b: Modem Status |
| 0 | PI | R | 0x1 | UART Interrupt 1b: UART interrupt 0b: no UART interrupt |

The **UARTIIR** register is available only when the user performs a register read. All fields in this register are read-only.

19.1.7. UARTFCTL

Register 19-6. UARTFCTL (UART FIFO Control, 0x401D 0008)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:6 | RT | W | 0x1 | RX FIFO Threshold 11b: 14 Bytes in FIFO 10b: 8 Bytes in FIFO 01b: 4 Bytes in FIFO 00b: 1 Byte in FIFO |
| 5:3 | Reserved | R | 0x0 | Reserved |
| 2 | TR | W | 0x0 | TX FIFO reset 1b: clear TX FIFO, bit auto clears 0b: no action |
| 1 | RR | W | 0x0 | RX FIFO reset 1b: clear RX FIFO, bit auto clears 0b: no action |
| 0 | EN | W | 0x0 | FIFO enable 1b: enable RX, TX FIFO 0b: disable RX, TX FIFO |

The **UARTFCTL** register is available only when the user performs a register write. All fields in this register are write-only.

19.1.8. UARTLCR

Register 19-7. UARTLCR (UART Line Control, 0x401D 000C)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7 | DLAB | RW | 0x0 | Divisor Latch Access 1b: Allow access to the divisor latch 0b: Allow access to the FIFOs and IER |
| 6 | SB | RW | 0x0 | Break Control 1b: force TX to 0b 0b: normal operation |
| 5 | SP | RW | 0x0 | Stick Parity 1b: enable 0b: disable |
| 4 | EPS | RW | 0x0 | Parity type 1b: generate EVEN parity 0b: generate ODD parity |
| 3 | PEN | RW | 0x0 | Parity Bit 1b: enable Parity 0b: disable Parity |
| 2 | STB | RW | 0x0 | Stop Bits 1b: 2 STOP bits (1.5 STOP bits for BPC=00) 0b: 1 STOP bit |
| 1:0 | BPC | RW | 0x0 | Bits per Character 11b: 8 bits 10b: 7 bits 01b: 6 bits 00b: 5 bits |

19.1.9. UARTMCR

Register 19-8. UARTMCR (UART Modem Control, 0x401D 0010)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:5 | Reserved | R | 0x0 | Reserved |
| 4 | LP | RW | 0x0 | Loopback 1b: loopback enabled 0b: loopback not enabled |
| 2:0 | Reserved | RW | 0x0 | Reserved |

19.1.10. UARTLSR

Register 19-9. UARTLSR (UART Line Status, 0x401D 0014)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7 | RFE | R | 0x0 | RX FIFO Error 1b: at least 1 parity, framing or break error active in FIFO 0b: no error in RX FIFO |
| 6 | TE | R | 0x1 | TX Empty 1b: TX shift register and TX FIFO are empty 0b: not empty |
| 5 | THR | R | 0x1 | TX FIFO Empty 1b: TX FIFO are empty 0b: not empty |
| 4 | BI | R | 0x0 | RX Break 1b: entry on top of RX FIFO has break error, bit clears on read 0b: error cleared |
| 3 | FE | R | 0x0 | RX Framing Error 1b: entry on top of RX FIFO has framing error, bit clears on read 0b: error cleared |
| 2 | PE | R | 0x0 | RX Parity Error 1b: entry on top of RX FIFO has parity error, bit clears on read 0b: error cleared |
| 1 | OE | R | 0x0 | RX Overrun error 1b: RX FIFO full and last entry overwritten, bit clears on read 0b: error cleared |
| 0 | DR | R | 0x0 | RX Data ready 1b: at least 1 entry in RX FIFO 0b: RX FIFO empty |

19.1.11. UARTSP

Register 19-10. UARTSP (UART Scratch Pad, 0x401D 001C)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|----------------|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | 8b scratch pad |

19.1.12. UARTFCTL2

Register 19-11. UARTFCTL2 (FIFO Control, 0x401D 0020)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:6 | RT | RW | 0x1 | RX FIFO Threshold 11b: 14 Bytes in FIFO 10b: 8 Bytes in FIFO 01b: 4 Bytes in FIFO 00b: 1 Byte in FIFO |
| 5:3 | Reserved | R | 0x0 | Reserved |
| 2 | TR | RW | 0x0 | TX FIFO reset 1b: clear TX FIFO, bit auto clears 0b: no action |
| 1 | RR | RW | 0x0 | RX FIFO reset 1b: clear RX FIFO, bit auto clears 0b: no action |
| 0 | EN | RW | 0x0 | FIFO enable 1b: enable RX, TX FIFO 0b: disable RX, TX FIFO |

19.1.13. UARTIER2

Register 19-12. UARTIER2 (UART Interrupt Enable, 0x401D 0024)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:4 | Reserved | R | 0x0 | Reserved |
| 3 | MSI | RW | 0x0 | Modem Status interrupt enable 1b: enable interrupt 0b: disable interrupt |
| 2 | RLSI | RW | 0x0 | Receive interrupt enable 1b: enable interrupt 0b: disable interrupt |
| 1 | THREI | RW | 0x0 | TX register empty interrupt enable 1b: enable interrupt 0b: disable interrupt |
| 0 | RDAI | RW | 0x0 | RX register data available interrupt enable 1b: enable interrupt 0b: disable interrupt |

19.1.14. UARTDL_L2

Register 19-13. UARTDL_L2 (UART Divisor Latch Low Byte, 0x401D 0028)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | Divisor value, low byte (does not need DLAP = 0 in order to work). |

19.1.15. UARTDL_H2

Register 19-14. UARTDL_H2 (UART Divisor Latch High Byte, 0x401D 002C)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | Divisor value, high byte (does not need DLAP = 0 in order to work). |

19.1.16. UARTFD_F

Register 19-15. UARTFD_F (UART Fractional Divisor Value, 0x401D 0038)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--------------------------|
| 31:8 | Reserved | R | 0x0 | Reserved |
| 7:0 | VAL | RW | 0x0 | Fractional divisor value |

19.1.17. UARTSTAT

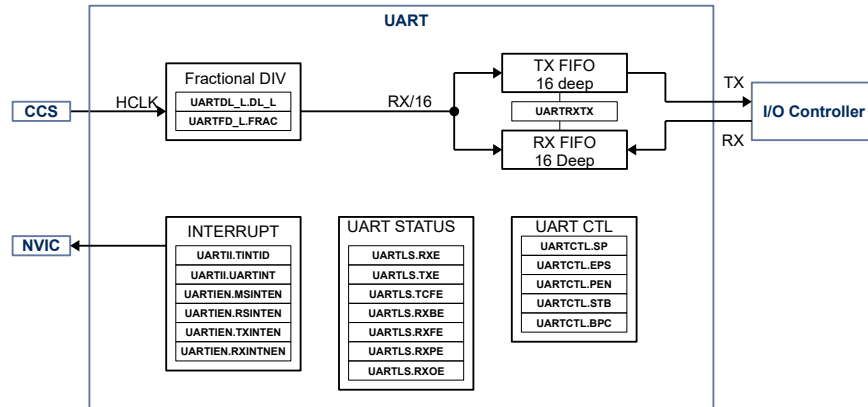

Register 19-16. UARTSTAT (UART FIFO Status, 0x401D 0040)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:4 | Reserved | R | 0x0 | Reserved |
| 3 | RXFULL | R | 0x0 | RX FIFO full 1b: RX FIFO full 0b: RX FIFO not full |
| 2 | RXEMPTY | R | 0x1 | RX FIFO empty 1b: RX FIFO empty 0b: RX FIFO not empty |
| 1 | TXFULL | R | 0x0 | TX FIFO full 1b: TX FIFO full 0b: TX FIFO not full |
| 0 | TXEMPTY | R | 0x1 | TX FIFO empty 1b: TX FIFO empty 0b: TX FIFO not empty |

19.2. Details of Operation

19.2.1. Block Diagram

Figure 19-1. UART

19.2.2. Configuration

Following blocks need to be configured for correct use of the UART:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- I/O Controller

19.2.3. UART

The UART supports up to 3.125 Mbps communication speed, has programmable clock selection with fractional divider, loop back mode for testing, 16 Byte transmit and 16 Byte receive FIFO with programmable receive interrupt threshold.

19.2.4. UART Clock Rate Setting

The UART block has a fractional divider to set up the baud rate. The UART clock is fed by the HCLK. The UART clock must be set to 16x the desired RX TX baud rate setting for correct functioning.

To calculate settings for **UARTDL_H**, **UARTDL_L**, **UARTFD_F**, first calculate the desired divider setting using following formula:

$$UARTDivisor = \frac{HCLK}{BAUDRATE * 16} \quad (6)$$

Where:

UARTDivisor: calculated divisor

HCLK: HCLK frequency in Hz

BAUDRATE: desired Baud rate

The integer portion of UART divisor is used to set **UARTDL_H**, **UARTDL_L**.

To calculate the value of **UARTFD_F**, use formula below and round to the nearest integer.

$$UARTFD = UARTDivisor_{frac} * 256 \quad (7)$$

Where:

UARTFD: calculated UARTFD value

UARTDIVISOR_FRAC: UARTDivisor fractional value

To calculate Baud rate error use following:

$$BAUDRATEERROR = BAUDRATE - (HCLK / (UARTDivisor + UARTDivisor_{frac} / 256)) / 16 \quad (8)$$

Where:

BAUDRATEERROR: absolute baud rate error

BAUDRATE: Baudrate

HCLK: HCLK frequency in Hz

UARTDivisor: UART divisor integer value

UARTDivisor_frac: UART divisor fractional value

To calculate relative Baud rate error use following:

$$Relative\ BAUDRATEERROR = BAUDRATEERROR / BAUDRATE * 100 \quad (9)$$

Where:

Relative BAUDRATE ERROR: relative BAUD rate error in %.

BAUDRATEERROR: absolute Baudrateerror

BAUDRATE: desired baudrate setting

The table below shows pre-calculated divisor settings for common Baud rates with 50MHz HCLK.

Register 19-17. UART Divisor Settings for 50 MHz HCLK

| Baud Rate | Desired Divisor | Int | frac | UARTDL_H | UARTDL_L | UARTFD_F | Absolute BAUD rate error | BAUD rate error % |
|-----------|-----------------|-------|------|----------|----------|----------|--------------------------|-------------------|

19.2.5. Data settings

The **UARTLCR** register defines the character settings like number of data bits, parity and number of stop bits

19.2.6. FIFO Settings

The FIFO can be configured with the **UARTFCTL** register. FIFO enable, depth and TX/RX FIFO reset can be configured. The FIFO status can be monitored in the **UARTLSR** register. A write to **UARTRXTX** writes to the TX FIFO, while a read from **UARTRXTX** reads from RX FIFO.

19.2.7. Error Checking on Received Data

The character specific error does not show up in **UARTLSR** until the character is at the top of the RX FIFO.

Each captured character is checked for following errors

- Break Error **UARTLSR.RXBE** – there was a logic '0' detected on the RX input for more than one character transmission period ($\text{BAUD RATE} * (1 \text{ startbit} + \text{UARTLCR.BPC data bits} + 1 \text{ parity bit} + \text{UARTLCR.STB stopbits})$)
- Framing Error **UARTLSR.RXFE** – there was a logic '0' detected where there should be a STOP bit
- Parity Error **UARTLSR.PE** – received parity and calculated parity do not match.

20.1.2. SOCBCTL

Register 20-1. SOCBCTL (SOC Bus Bridge Control, 0x4020 0000)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:9 | Reserved | R | 0x0 | Reserved |
| 8 | Reserved | RW | 0x0 | Reserved, set to 0x0 |
| 7 | Reserved | RW | 0x0 | Reserved, set to 0x1 |
| 6 | Reserved | RW | 0x0 | Reserved, set to 0x1 |
| 5 | MTRARM | W | 0x0 | MTRANS re-arm Writing a 1b to this bit re-arms the SOCBCTL.MTRANS operation by de-asserting the CSx chip select and returning the master mode state machine to IDLE. |
| 4:2 | Reserved | RW | 0x0 | Reserved, set to 0x0 |
| 1 | SIE | RW | 0x0 | SOC Bus Bridge interrupt enable. 1b = Enable the interrupt 0b = Disable the interrupt |
| 0 | SSEN | RW | 0x0 | SOC Bus Bridge enable: 1b = Enable this module. 0b = Disable this module. |

20.1.3. SOCBCFG

Register 20-2. SOCBCFG (SOC Bus Bridge Configuration, 0x4020 0004)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|----------------------|
| 31:14 | Reserved | R | 0x0 | Reserved |
| 13 | Reserved | RW | 0x0 | Reserved, set to 0x0 |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|----------|--------|-------|--|
| 12 | Reserved | RW | 0x0 | Reserved, be set to 0x0 |
| 11 | Reserved | RW | 0x0 | Reserved, be set to 0x1 |
| 10 | Reserved | RW | 0x0 | Reserved, be set to 0x1 |
| 9:6 | Reserved | RW | 0x0 | Reserved, be set to 0x0 |
| 5 | Reserved | RW | 0x0 | Reserved, be set to 0x0 |
| 4 | Reserved | RW | 0x0 | Reserved, be set to 0x0 |
| 3 | Reserved | RW | 0x0 | Reserved, mbe set to 0x0 |
| 2 | MRST | RW | 0x0 | Module reset. 1b: Force soft reset of module. The internal state machines are reset; Status register is cleared; However, the soft reset doesn't affect control register values. 0b: do not hold the module in reset. |
| 1:0 | Reserved | RW | 0x0 | Reserved, set to 0x0 |

20.1.4. SOCBCLKDIV

Register 20-3. SOCBCLK (SOC Bus Bridge Clock Divider, 0x4020 0008)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|----------|--------|-------|---|
| 31:16 | Reserved | R | 0x0 | Reserved |
| 15:0 | CLKDIV | RW | 0x8 | Clock divisor for SCLK: $SCLK = HCLK / [(CLKDIV+1)*2]$ the minimum divider is /2 |

20.1.5. SOCBSTAT

Register 20-4. SOCBSTAT (SOC Bus Bridge Status, 0x4020 0014)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|----------|--------|-------|---|
| 31:15 | Reserved | R | 0x0 | Reserved |
| 14:12 | CURSTATE | RW | 0x0 | Raw status of the SOC bus bridge master state machine's "current_state" register. 111b: CSBEGIN 110b: MTRANS 101b: CKWAIT 100b: CSWAIT 011b: CSHOLD 010b: TRANSFER 001b: CSSETUP 000b: IDLE |
| 11 | Reserved | R | 0x0 | Reserved |
| 10 | RXFULL | R | 0x0 | Raw indicator that the Rx incoming holding register contains a valid data word. 1b: Rx incoming holding register contains a valid data word. 0b: Rx incoming holding register contains no valid data word. |
| 9 | TXFULL | R | 0x0 | Raw indicator that the Tx outgoing holding register is still in use, and not ready to accept another data word. 1b: Tx outgoing holding register is still in use not ready to accept another data word. 0b: Tx outgoing register is ready to accept another data word |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-----------------|--------|-------|---|
| 8 | WRUFL | RW | 0x0 | Write Buffer Underflow: set on the start of a second outgoing transfer if data hasn't been written to the SOCBD after the previous transfer 1b: Write Underflow detected, clear by writing 1b to it 0b: No Write Underflow since this bit was cleared Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SOCBINT_EN.WRUFL_EN . |
| 7:6 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 5 | CYC_DONE | RW | 0x0 | Cycle Done: this bit will set when the current transfer of 8 bits is complete. It indicates that 8 bits were sent on the transmit port and 8 bits were sampled on the receive port. 1b: Cycle done detected, clear by writing 1b to it 0b: No Cycle Done detected since this bit was cleared Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SOCBINT_EN.CYC_DONE_EN . |
| 4:3 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 2 | RDOFL | RW | 0x0 | Read Buffer Overflow: set on the completion of a second incoming transfer if data hasn't been read from the SOCBD from the previous transfer 1b: Read Overflow detected, clear by writing 1b to it 0b: No Read Overflow since this bit was cleared Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SOCBINT_EN.RDOFL_EN . |
| 1 | Reserved | R | 0x0 | Reserved |
| 0 | SOCB_INT | R | 0x0 | SOC bus bridge Interrupt Logical OR of each raw status bit WRUFL, RDOFL, and CYC_DONE, qualified with its corresponding SOCBINT_EN enable. 1b: interrupt 0b: no interrupt Note that if the corresponding SOCBINT_EN of those status bits is reset to '0', those status bits themselves will still assert upon meeting the condition, but will not contribute to the assertion of SOCB_INT. The status bits are true "raw" status bits, and the corresponding SOCBINT_EN simply allows them to cause an interrupt. |

20.1.6. SOCBCSSTR

Register 20-5. SOCBCSSTR (SOC Bus Bridge Chip Select Steering, 0x4020 0018)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|------------------------------|
| 31:24 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 23:20 | CSSETUP | RW | 0x0 | Chip Select Setup |
| 19:16 | CSHOLD | RW | 0x0 | Chip Select Hold |
| 15:12 | CSWAIT | RW | 0x0 | Chip Select Wait |
| 11:8 | CKWAIT | RW | 0x0 | SOC Bus Bridge Clock Wait |
| 7:0 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |

20.1.7. SOCBD

Register 20-6. SOCBD (SOC Bus Bridge Data, 0x4020 001C)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|---|
| 31:8 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 7:0 | DATA | RW | 0x0 | SOC bus bridge data On READ: retrieve received data word from the incoming holding buffer. On WRITE: write a address or data word to the outgoing holding buffer. |

20.1.8. SOCBINT_EN

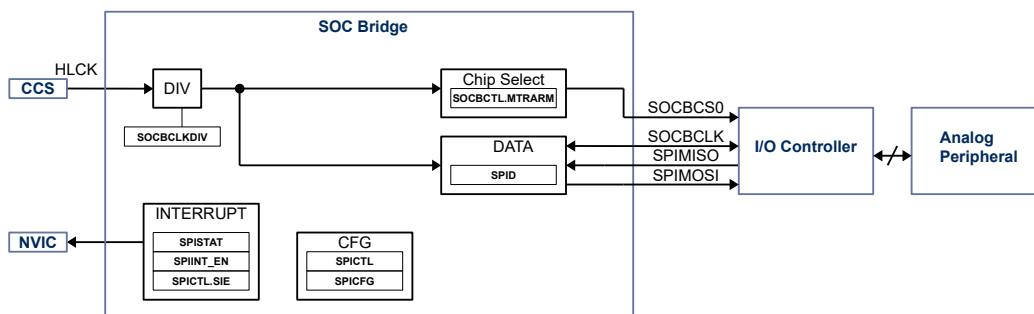

Register 20-7. SOCBINT_EN (SOC Bus Bridge Interrupt Enable, 0x4020 0020)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:9 | Reserved | RW | 0x0 | Reserved |
| 8 | WRUFL_EN | RW | 0x0 | Write buffer underflow WRUFL interrupt enable 1b: enable SOCBSTAT.WRUFL interrupt 0b: disable SOCBSTAT.WRUFL interrupt |
| 7:6 | Reserved | RW | 0x0 | Reserved, set to 0x0 |
| 5 | CYC_DONE | RW | 0x1 | Cycle done interrupt enable 1b: enable SOCBSTAT.CYC_DONE interrupt 0b: disable SOCBSTAT.CYC_DONE interrupt |
| 4:3 | Reserved | RW | 0x1 | Reserved, set to 0x0 |
| 2 | RDOFL_EN | RW | 0x1 | Read buffer overflow RDOFL interrupt enable 1b: enable SOCBSTAT.RDOFL interrupt 0b: disable SOCBSTAT.RDOFL interrupt |
| 1:0 | Reserved | RW | 0x0 | Reserved |

20.2. Details of Operation

20.2.1. Block Diagram

Figure 20-1. SOC Bridge

20.2.2. Configuration

Following blocks need to be configured for correct use of the SPI:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller

20.2.3. SOC Bridge

The SOC bridge is used to set and read registers in the analog section of the device.

20.2.4. SOC Bridge Clock Rate Setting

The SOC bridge Module SOCCLK is derived from HCLK to drive the SPI logic, generate setup, hold and wait timings for CSx signals, and SOCCLK.

The SPICLK clock is derived from HCLK using a clock divider configurable with **SOCCLKDIV**. The lowest clock allowable divider in SPI slave mode is HCLK/8. In SPI Master mode the lowest allowable clock divider is HCLK/2.

To calculate SOCCLK use

$$SOCCLK = \frac{HCLK}{(SOCCLKDIV + 1) * 2} \quad (10)$$

Where:

SOCCLK: SOCCLK in Hz

HCLK: HCLK in Hz

SOCCLKDIV: **SOCCLKDIV** setting

20.2.5. Enable and Setup of SOC Bridge

20.2.6. SOC Interrupt

The SOC bridge engine interrupt is enabled with **SOCBCTL.SIE**. Then any sub interrupts are enabled in **SINT_EN**.

20.2.7. SOC Bridge Protocol

The SOC bridge protocol is a 2 byte protocol, the first byte is the address packet including a 7-bit address [7:1] and a write bit [0], the second packet is an 8bit data packet.

20.2.8. Reading from SOC Bridge

To read to the SOC bridge, start with writing the address packet to **SOCBD** first. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Then write a second dummy address packet to **SOCBD** to clock out the data packet. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Set **SOCBCTL.MTRARM** to 1b to deassert SOCBCS0. Then read from **SOCBD** to get the data packet content

Figure 20-2. Single Read from SOC Bridge

20.2.9. Writing to SOC Bridge

To write to the SOC bridge, start with writing the address packet to **SOCBD** first. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Then write the data packet to **SOCBD**. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Set **SOCBCTL.MTRARM** to 1b to deassert SOCBCS0. Optional you read from **SOCBD** to get the data packet content with old data content of the register address.

Figure 20-3. Single Write to SOC Bridge

21. SPI

| 0x4021 001C | SPID | SPI data | 0x0000 0000 |
| 0x4021 0020 | SPIINT_EN | SPI interrupt enable | 0x0000 0000 |

21.1.2. SPICTL

Register 21-1. SPICTL (SPI Control, 0x4021 0000)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|------|-----------------|--------|-------|--|
| 31:9 | Reserved | R | 0x0 | Reserved |
| 8 | RTRANS | RW | 0x0 | Auto-retransmit on UCLK error. 1b: On a UCLK error, the transmit holding register does NOT get reset, so the word that was transmitting when the UCLK error occurred remains queued. 0b: On a UCLK error, the transmit holding register is reset, and the word that was transmitting when the UCLK error occurred is lost. |
| 7 | MMST_N | RW | 0x0 | Multi-master mode (MASTER ONLY) 1b: Single-Master mode, always drive a value onto CSx, SPICLK and MOSI. 0b: Multi-master mode, always tri-state the CSx, SPICLK and MOSI lines when a transfer is complete. |
| 6 | MTRANS | RW | 0x0 | Multiple Transfer Mode (MASTER ONLY) 1b: Generate multiple transfers of [SPICFG.WL] bits within a single CSx assertion. 0b: Generate single transfers (assert CSx, transfer data word of [SPICFG.WL] bits, de-assert CSx). |
| 5 | MTRARM | W | 0x0 | MTRANS re-arm (MASTER ONLY): Writing a 1b to this bit re-arms the SPICTL.MTRANS operation by de-asserting the CSx chip select and returning the master mode state machine to IDLE. |
| 4 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 3 | SE | RW | 0x0 | Slave Enable 1b: SPI is a SLAVE. 0b: SPI is a MASTER. |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-------------|--------|-------|---|
| 2 | LPBK | RW | 0x0 | Internal loop back Mode 1b: Tie the serial out source to the serial in line (internal signaling, does not traverse the chip IO bi-di buffers). 0b = Normal operation. |
| 1 | SIE | RW | 0x0 | SPI Interrupt enable. 1b = Enable the interrupt 0b = Disable the interrupt |
| 0 | SSEN | RW | 0x0 | SPI enable: 1b = Enable this module. 0b = Disable this module. |

21.1.3. SPICFG

Register 21-2. SPICFG (SPI Configuration, 0x4021 0004)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-------|-----------------|--------|-------|---|
| 31:14 | Reserved | R | 0x0 | Reserved |
| 13 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 12 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 11 | MTURBO | RW | 0x0 | Master “turbo” operation mode: 1b: Enable master turbo mode, using HCLK-based bit count, allowing operation down to max 2:1 HCLK:SPICLK ratio 0b: Disable master turbo mode, legacy operation down to max 8:1 HCLK:SPICLK ratio. |
| 10 | TXDBUF | RW | 0x0 | Transmit Double-Buffer mode: 1b: enable double-buffer “ping-pong” on shift register transmit output path (keep up with back-to-back words at faster HCLK:SPICLK ratios) 0b: disable double-buffer, legacy operation with a single shift register buffer and single queuing buffer |
| 9 | TXDATPH | RW | 0x0 | Early Transmit Data Phase. 1b: Enable: MISO (slave mode) or MOSI(master mode) transitions occur ½ an SPICLK period sooner than the normal protocol (i.e. transition on capture edge instead of launch edge) 0b: Disable: normal transmit data phase, transitions are on the launch edge of SPICLK |
| 8 | Reserved | RW | 0x0 | Reserved, must be set to 0x0 |
| 7 | RCVCPH | RW | 0x0 | SLAVE MODE Clock Phase 1b: Second clock transition of a new transfer is used to sample data 0b: First clock transition of a new transfer is used to sample data |
| 6 | RCVCP | RW | 0x0 | SLAVE MODE Clock Polarity 1b: SPICLK is HI in its inactive state 0b: SPICLK is LO in its inactive state |
| 5 | CPH | RW | 0x0 | MASTER MODE Clock Phase 1b: Second clock transition of a new transfer is used to sample data 0b: First clock transition of a new transfer is used to sample data |
| 4 | CP | RW | 0x0 | MASTER MODE Clock Polarity 1b: SPICLK is HI in its inactive state 0b: SPICLK is LO in its inactive state |
| 3 | LB1ST | RW | 0x0 | Least Bit First 1b: LSB is the first serial bit of a transfer 0b: MSB is the first serial bit of a transfer |

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-------------|--------|-------|---|
| 2 | MRST | RW | 0x0 | Module reset. 1b: Force soft reset of module. The internal state machines are reset; Status register is cleared; However, the soft reset doesn't affect control register values. 0b: do not hold the module in reset. |
| 1:0 | WL | RW | 0x0 | Word Length select 11b: Word Length = 32-bits 10b: Word Length = 24-bits 01b: Word Length = 16-bits 00b: Word Length = 8-bits |

21.1.4. SPICLKDIV

Register 21-3. SPICLKDIV (SPI Clock Divider, 0x4021 0008)

| 1:0 | Reserved | RW | 0x0 | Reserved |

21.2. Details of Operation

21.2.1. Block Diagram

Figure 21-1. SPI

21.2.2. Configuration

Following blocks need to be configured for correct use of the SPI:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller

21.2.3. SPI

The SPI engine has selectable data byte ordering LSB or MSB first, 4 different data / clock modes, can send / receive packets 8, 16, 32, 64 boundaries, selectable CS polarity, soft reset, and auto-retransmit.

In master mode it supports up to 3 different slaves using chip select. The master mode also allows sending multiple packets per CS.

21.2.4. SPI Clock Rate Setting

The SPI Module `SPICLK` is derived from `HCLK` to drive the SPI logic, generate setup, hold and wait timings for `CSx` signals, and `SPICLK`.

The `SPICLK` clock is derived from `HCLK` using a clock divider configurable with **`SPICLKDIV`**. The lowest clock allowable divider in SPI slave mode is `HCLK/8`. In SPI Master mode the lowest allowable clock divider is `HCLK/2` if **`SPICFG.MTURBO`** is 1b, `HCLK/8` if **`SPICFG.MTURBO`** is 0b. **`SPICFG.MTURBO`** works only in Master mode.

To calculate `SCLK` use

$$SCLK = \frac{HCLK}{(SPICLKDIV + 1) * 2} \quad (11)$$

Where:

SCLK: SCLK in Hz

HCLK: HLCK in Hz

SPICLKDIV: **SPICLKDIV** setting

21.2.5. Master Slave Mode

The master mode is selected with **SPICTL.SE** = 0b. In master mode a write to **SPID** will initiate SPI data transfer.

When **SPICFG.TXDBUF** is set to 1b, the **SPID** is double buffering is enabled, allowing queuing of the next data word while the current one is transferred.

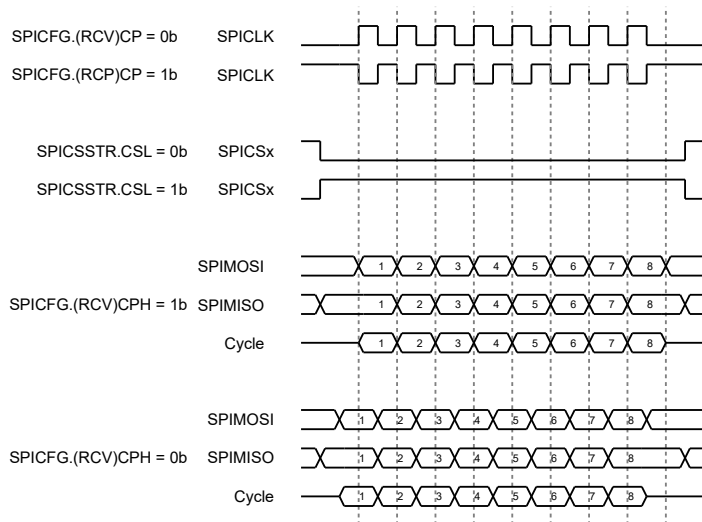

21.2.6. Clock Phase, Polarity

The clock and phase can be programmed independently for master and slave.

The master mode clock polarity is configured with **SPICFG.CP** and the phase is configured with **SPCFG.CPH**.

The slave mode clock polarity is configured with **SPICFG.RCVCP** and the phase is configured with **SPICFG.RVCPH**.

Figure 21-2. SPI clock polarity and phase

21.2.7. SPI Early Data Transmit

For cases when the SPI is running at high speed the transmitted data can be transmitted 1/2 a SPICLK early to compensate for delays on the receiver side. When **SPICFG.TXDATPH** is 1b, SPIMOSI is transmitted 1/2 SPICLK early in master mode. In slave mode SPIMISO is transmitted 1/2 SPICLK early.

Figure 21-3. SPIMOSI early transmit in master mode

Figure 21-4. SPIMISO early transmit in slave mode

21.2.8. Data Format

The **SPICFG.WL** sets the word length from 8bit to 32bit in 8bit steps.

The **SPICFG.LB1ST** configures the data format to transmit, LSB ior MSB first.

21.2.9. Chip Select Settings

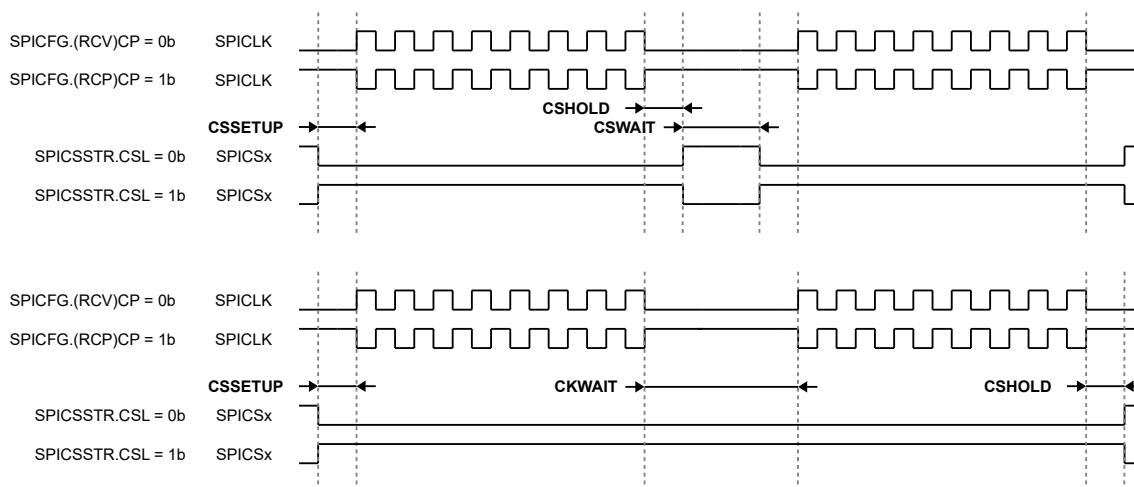

The SPI engine supports up to 3 chip select signals SPICS0, SPICS1 and SPICS2, selectable with **SPICSSTR.CSNUM**.

The CS polarity can be set with **SPICSSTR.CSL**, 0b for active low, 1b for active high.

In SPI engine can automatically assert and deassert SPICSx with each data transaction with **SPICTL.MTRANS** = 0b. To allow multiple data words within a SPICSx assertion set **SPICTL.MTRANS** to 1b. The first data word will assert SPICSx. SPICSx will remain low until it is deasserted with writing **SPICTL.MTARM** to 1b.

Timings for CS behavior can be programmed with granularity of SPICLK. The period between assertion of SPICSx and SPICLK transition can be set with **SPICSSTR.CSSETUP**. The period between last SPICLK transition and deassertion of SPICSx can be set with **SPICSSTR.CSHOLD**. The period between deassertion and assertion of SPICSx can be set with **SPICSSTR.CSWAIT**. The period between SPICLK transitions between multi word packages can be set with **SPICSSTR.CKWAIT**.

Figure 21-5. SPICSx

21.2.10. Auto Retransmit Data Word

Upon detection of an undercount **SPISTAT.UCLK** error, the default behavior of the SPI module is to reset the SERDES bit counters and the transmit side holding buffers, assuming that software must re-load the word that did not complete transmission because of the UCLK error.

Note that the receive side holding buffers are **not** reset, and contain the data word received from the last **good** transfer.

An optional mode is provided by setting the RTRANS bit in the **SPICTL.RTRANS**. When set, the reset of the transmit side holding buffers because of UCLK error is disabled, and the word that did not complete transmission remains queued for transmit.

21.2.11. Loop Back Mode

The SPI engine has a loop back mode for test purposes, enabled with **SPICTL.LPBK**. The loop back mode is only available in master mode. In loop back mode, SPIMOSI and SPIMISO are connected together internally

and SPICLK, SPIMOSI, SPCSx can be still observed on pins.

21.2.12. SPI Interrupt

The SPI engine interrupt is enabled with **SPICTL.SIE**. Then any sub interrupts are enabled in **SPIINT_EN**.

21.2.13. SPI Enable

The SPI engine is enabled with **SPICTL.SSEN**. To soft reset the state machine and clear all status bits use **SPICFG.MRST**.

22. MULTI-MODE POWER MANAGER

22.1. Register

22.1.1. Register Map

Table 22-1. Multi-Mode Power Manager Register Map

| ADDRESS | NAME | DESCRIPTION | RESET VALUE |
|---------------------------------|-----------------|----------------------------------|-------------|
| Multi-Mode Power Manager | | | |

22.1.2. SYSSTAT

Register 22-1. SYSSTAT (System Status, 0x00)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-----------------|--------|-------|--|
| 7 | PBSTAT | R/W | 0x0 | Push button status. When not masked, bit set on interrupt and cleared when written to 1b. When masked, bit is transparent. |
| 6 | TMPWARN | R | 0x0 | Temperature warning to indicate the temperature is over 140°C. When TMPWARN is not masked, this bit is latch when temperature is out of valid range and cleared when bit is read. When masked, bit is transparent. |
| 5:4 | VTHREF | R/W | 0x0 | Programmable threshold voltage. Used for AMP6 through AMP9 in comparator mode. 00b: 0.1V 01b: 0.2V 10b: 0.5V 11b: 1.25V |
| 3 | REFBP | R/W | 0x0 | Set external reference bypass via AB5. |
| 2 | Reserved | R/W | 0x0 | |
| 1 | FLTM | R/W | 0x0 | Fault mask (active high). Set to 1b to mask temperature fault. 0b: not masked 1b: masked |
| 0 | nINTM | R/W | 0x0 | Interrupt mask (active low) 0b: masked 1b: not masked |

22.1.3. DEVID

Register 22-2. DEVID (Device Identification, 0x08)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-------|--------|-------|-----------------------|
| 7:0 | DEVID | R | - | Device identification |

22.1.4. VERID

Register 22-3. VERID (Version Identification, 0x09)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-------|--------|-------|------------------------|
| 7:0 | VERID | R | - | Version identification |

22.1.5. PWRCTL

Register 22-4. PWRCTL (Power Manager Control, 0x10)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|----------|--------|-------|--|
| 7 | HIB | R/W | 0x0 | Hibernate mode. This bit is cleared and power up sequence is initiated after the wake up timer delay or external event. 0b: normal 1b: shutdown mode |
| 6 | MCUALIVE | R/W | 0x0 | Micro-controller alive flag. Bit that MCU can set in the Power Manager to indicate that it has already initialized itself. Can be used by MCU to detect that it has been reset by the AFE. The convention is for the MCU to write this bit to 1b on initialization of the AFE, and test that it is not 1 during start-up. |
| 5:3 | PWRMON | R/W | 0x0 | Power monitor select. Selects the voltage signal for power monitoring at A/D converter input selector. 000b: V_{CC18} 001b: V_{CC33} scaled by 4/10 010b: V_{CCIO} scaled by 4/10 011b: V_{SYS} scaled by 4/10 100b: V_{REGO} scaled by 1/10 101b: V_P scaled by 1/10 110b: V_{HM} scaled by 1/30 111b: V_{COMP} internal error amplifier output |
| 2:0 | WUTIMER | R/W | 0x0 | Wake-up timer delay 000b: infinite 001b: 125ms 010b: 250ms 011b: 500ms 100b: 1s 101b: 2s 110b: 4s 111b: 8s |

22.1.6. PWRSTAT

Register 22-5. PWRSTAT (Power Manager Status, 0x11h, Persistent In Hibernate Mode)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|-----------------|--------|-------|--|
| 7 | HWRSTAT | R | - | Hardware reset status. When not masked, bit is set on Hardware Reset and cleared when written to 1b. |
| 6 | WDTRSTAT | R | - | Watchdog timer reset status. When enabled, it is set on Watchdog Timer Reset and cleared when written to 1b. |
| 5 | MMSSFLT | R | - | Multi-mode switching supply fault status. Bit set on fault and cleared when written to 1b. |
| 4 | TMPFLT | R | - | Temperature fault status. Bit set on fault and cleared when written to 1b. |
| 3 | VSYSFLT | R | - | V _{SYS} fault status. Bit set on fault and cleared when written to 1b. |
| 2 | VCCIOFLT | R | - | V _{CCIO} fault status. Bit set on fault and cleared when written to 1b. |
| 1 | VCC33FLT | R | - | V _{CC33} fault status. Bit set on fault and cleared when written to 1b. |
| 0 | VCC18FLT | R | - | V _{CC18} fault status. Bit set on fault and cleared when written to 1b. |

22.1.7. PSTATSET

Register 22-6. PSTATSET (Power Manager Setting, 0x12h)

| BIT | NAME | ACCESS | RESET | DESCRIPTION |
|-----|----------------|--------|-------|---|
| 7 | UNLOCK | R/W | 0x0 | Software unlock. Write to 1b to enable writing to SCFG . 0b: SCFG locked 1b: SCFG unlocked |
| 6 | SU | R/W | 0x0 | Start-up. This bit is set to 0b when the device is powered up and may be written by the MCU to 1b at any time. This bit will retain its value as long as power to V _{HM} is applied. After reset, the MCU can read this bit to tell if the MCU has been forcibly reset (if the value is still a 1b) or if it is a power-up reset (the value will be reset to 0b). |
| 5 | VPLOW | R/W1C | 0x0 | V _p low status. When not masked, bit set on IRQ1 (MCU pin PB0) interrupt and cleared when written to 1b. |
| 4 | nPBINTM | R/W | 0x0 | Push button interrupt mask (active low) 0b: masked 1b: not masked |
| 3 | nVPINTM | R/W | 0x0 | V _p low IRQ1 (MCU pin PB0) interrupt mask (active low) 0b: mask 1b: not masked |
| 2 | TWD | R/W | 0x0 | Watchdog timer delay 0b: 8s 1b: 4s |
| 1 | WDTEN | R/W | 0x0 | Watchdog timer enable 0b: disabled 1b: enabled |
| 0 | PBEN | R/W | 0x0 | Push button enable 0b: disabled 1b: enabled |

22.1.8. IMOD

Register 22-7. IMOD (Current Modulation, 0x13)

| BITS | NAME | ACCESS | RESET | DESCRIPTION |
|------|-------------|--------|-------|---|
| 7:0 | IMOD | R/W | 0x00 | Current modulation. 0xFF (default) = 100%. Inductor current is clamped to $IL_{MAX} \cdot (IMOD_{<7:0>} - 0x20) / FFh$. Power factor control can be achieved by modulating $(IMOD_{<7:0>} - 0x20 - VSLOPE_ERROR)$ to be proportional to the input voltage, multiplied by the feedback error factor derived in servo loop with the low-pass-filtered output voltage. |

22.1.9. SCFG

Register 22-8. SCFG (Switching Supply Configuration, 0x14)

| BITS | NAME | ACCESS ⁽¹⁾ | RESET | DESCRIPTION |
|------|------------------|-----------------------|-------|---|
| 7 | SRST | R/W | 0x0 | Soft reset. Write to 1b to assert nRST and generate system soft reset. 0b: normal 1b: reset |
| 6 | DIGCTL | R/W | 0x0 | Digital control enable 0b: disabled 1b: enabled |
| 5 | VCLAMPDIS | R/W | 0x0 | V _{HM} voltage clamp disable 0b: enabled 1b: disabled |
| 4 | FMODE | R/W | 0x0 | Frequency mode 0b: low frequency range (45kHz to 125kHz) 1b: high frequency range (181kHz to 500kHz) |
| 3:1 | FSWM | R/W | 0x0 | Switching frequency <div> FMODE = 0b 000b: 45kHz 001b: 50kHz 010b: 55kHz 011b: 62.5kHz 100b: 72.25kHz 101b: 82.5kHz 110b: 100kHz 111b: 125kHz </div> <div> FMODE = 1b 000b: 181kHz 001b: 200kHz 010b: 220kHz 011b: 250kHz 100b: 289kHz 101b: 330kHz 110b: 400kHz 111b: 500kHz </div> |
| 0 | DMAX | R/W | 0x0 | Maximum duty 0b: 500ns minimum off time 1b: 75% maximum duty |

⁽¹⁾ This byte is unlocked for writing when **UNLOCK** = 1b.

22.1.10. SCFG2

Register 22-9. SCFG2 (Switching Supply Configuration 2, 0x15)

| BITS | NAME | ACCESS ⁽¹⁾ | RESET | DESCRIPTION |
|------|-----------------|-----------------------|---------------------|--|
| 7:6 | VP | R/W | Varies ³ | VP voltage setting when DC/DC is enabled 00b: 13.8V ⁴ 01b: 9V 10b: 12V 11b: 15V |
| 5 | SMPSON | R/W | 0x0 | DC/DC enable configuration 0b: DC/DC enabled 1b: DC/DC disabled |
| 4 | Reserved | R/W | 0x0 | Reserved, write as 0 |
| 3 | TRST | R/W | 0x0 | Reset time after POR for MCU 0b: 1ms 1b: 32ms |
| 4:0 | Reserved | R/W | 0x0 | Reserved, write as 0 |

³ Reset value for VP voltage setting varies. Consult the data sheet for the device for the reset value.

⁴ For some devices, a VP value of 00b represents 13.8V. Consult the data sheet for the correct value.

| 0 | SMEN | R/W | 0x0 | Signal Manager Enable 1b: Enabled 0b: Disabled |

23.2. Details of Operation

23.2.1. Block Diagram

Figure 23-1. Configurable Analog Front End

23.2.2. Configuration

Following blocks need to be configured for correct use of the Configurable analog frontend.

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- SOC Bridge

23.2.3. Configurable Analog Front End

The configurable analog front end registers are accessible through the SOC Bridge. AIOx can be configured as digital open drain I/Os or analog inputs.

Programmable comparators and protection circuits can be connected to the analog signals.

The analog signals can be conditioned with programmable gain single ended amplifiers or programmable gain differential amplifiers before muxed to the ADC.

23.2.3.1. Configurable Analog Front End Enable

Use **SOC.SMCTL.ENSIG** to enable the configurable analog front end.

23.2.3.2. Integrated Temperature Sensor

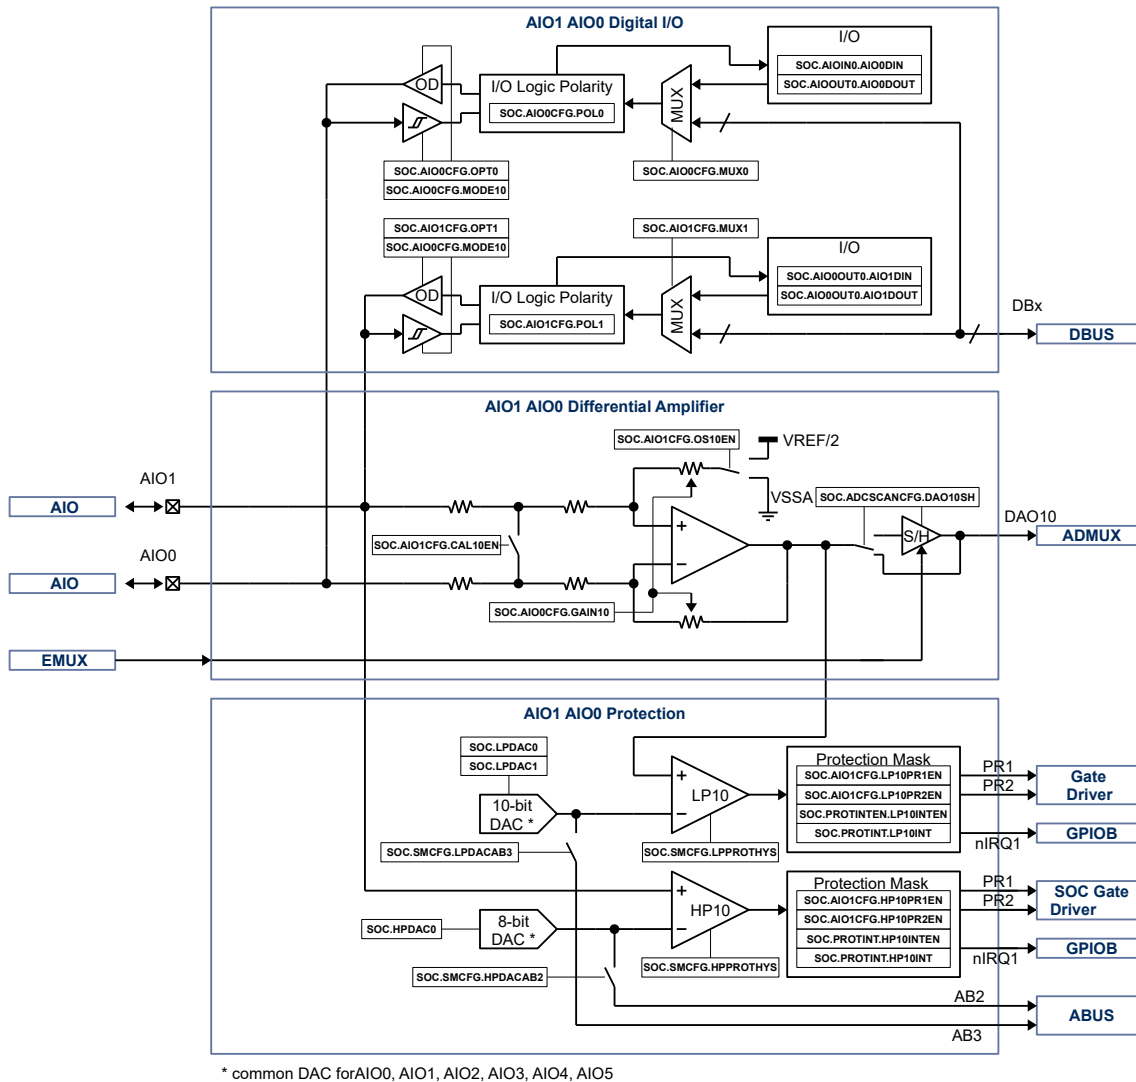

The CAFE contains an integrated temperature sensor that can be sampled on the AB10 analog bus. To read the temperature, sample this ADC channel and convert the ADC counts to °C by the following formula:

$$^{\circ}\text{C} = ((\text{ADC counts} - \text{TTEMP}) >> 1) + \text{FTTEMP}$$

23.3. AIO1, AIO0

23.3.1. Block Diagram

Figure 23-2. AIO1, AIO0

23.3.2. AIO1, AIO0

AIO1 and AIO0 can be configured as digital inputs or as differential amplifier pair with additional protection.

23.3.3. AIO1, AIO0 digital I/O Mode

Set **SOC.CFGAIO0.MODE10** = 00b to use AIO1 and AIO0 as digital inputs.

23.3.3.1. AIO0 IO

Set **SOC.CFGAIO0.OPT0** = 00b to use AIO0 as input. The input state can be read at **SOC.DINSIG0.AIO0DIN**.

Set **SOC.CFGAIO0.OPT0** = 10b to use AIO0 as open drain output. Set **SOC.CFGAIO0.MUX0** = 00b to mux the output state from **SOC.DOUTSIG0.AIO0DOUT**. Use **SOC.CFGAIO0.MUX0** to mux the output signal from the internal digital bus DBUS DB1 to DB7.

23.3.3.2. AIO1 IO

Set **SOC.CFGAIO1.OPT1** = 00b to use AIO1 as input. The input state can be read at **SOC.DINSIG0.AIO1DIN**.

Set **SOC.CFGAIO1.OPT1** = 10b to use AIO1 as open drain output. Set **SOC.CFGAIO1.MUX1** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO1DOUT**. Use **SOC.CFGAIO1.MUX1** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.3.3.3. AIO0 Polarity

Use **SOC.CFGAIO0.POL0** to set logic polarity of the signal between AIO0 input/output and MUX0.

23.3.3.4. AIO1 Polarity

Use **SOC.CFGAIO0.POL1** to set logic polarity of the signal between AIO1 input/output and MUX1.

23.3.4. AIO1, AIO0 differential Amplifier Mode

Set **SOC.CFGAIO0.MODE10** = 01b to use AIO1 and AIO0 as input to a differential amplifier.

23.3.4.1. AIO1, AIO0 Differential Amplifier Gain

Use **SOC.CFGAIO0.GAIN10** to set to gain between 1x to 48x.

23.3.4.2. AIO1, AIO0 Differential Amplifier Reference

Use **SOC.CFGAIO1.OS10EN** to set the amplifier reference either VSSA or VREF/2.

23.3.4.3. AIO1, AIO0 Differential Amplifier Calibration

Use **SOC.1.CAL10EN** to short the input of the differential amplifier to allow reading of the amplifier offset.

23.3.5. AIO1, AIO0 Protection

In **SOC.CFGAIO0.MODE10** = 01b differential amplifier mode, a high side comparator protector HP10 and a low side comparator protector LP10 are also active that can be configured to disabled high-side or low-side drivers

in the application specific power driver section.

23.3.5.1. HP10 Comparator

The HP10 comparator takes the AIO1 voltage referenced to VSSA and compares it against the HP-DAC voltage. The 8-bit HP-DAC is programmable with **SOC.HPDAC**.

Use **SOC.CFGAIO1.HP10EN** to enable HP10 comparator with different blanking times.

Use **SOC.SIGSET.HPROTHYS** to enable HP10 comparator hysteresis.

The output of HP10 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO1.HP10PR1EN** or protection signal PR2 using **SOC.AIO1CFG.HP10PR2EN**.

The output of HP10 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.HP10INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.HP10INT**.

23.3.5.2. LP10 Comparator

The LP10 comparator takes the output of the differential amplifier and compares it against the LP-DAC voltage. The 10-bit LP-DAC is programmable with **SOC.LPDAC0** and **SOC.LPDAC1**.

Use **SOC.CFGAIO0.LP10EN** to enable LP10 comparator with different blanking times.

Use **SOC.SIGSET.LPPROTHYS** to enable LP10 comparator hysteresis.

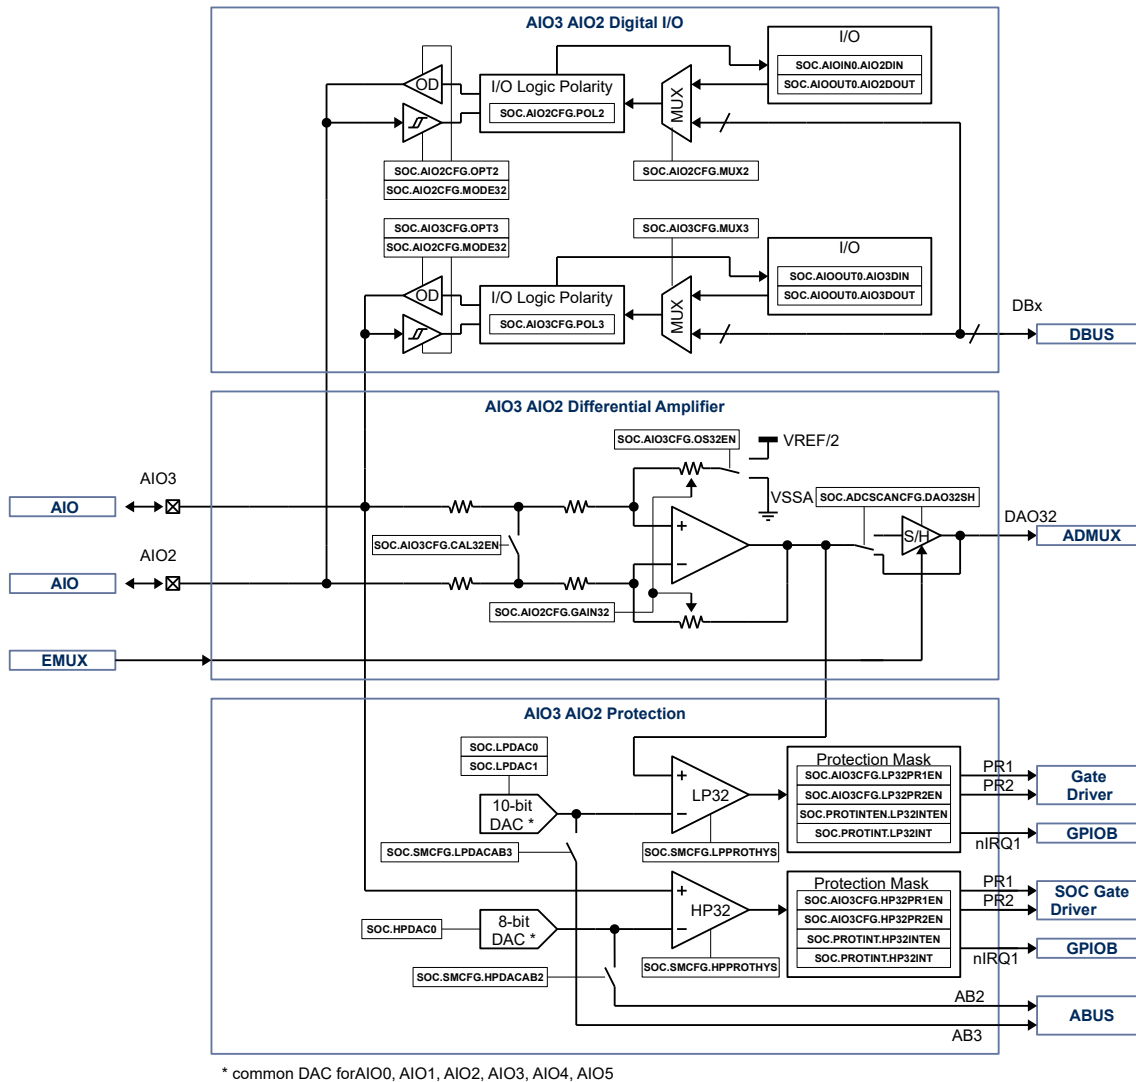

The output of LP10 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO1.LP10PR1EN** or protection signal PR2 using **SOC.CFGAIO1.LP10PR2EN**.

The output of LP10 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.LP10INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.LP10INT**.

23.4. AIO3, AIO2

23.4.1. Block Diagram

Figure 23-3. AIO3, AIO2

23.4.2. AIO3, AIO2

AIO3 and AIO2 can be configured as digital inputs or as differential amplifier pair with additional protection.

23.4.3. AIO3, AIO2 digital I/O Mode

Set **SOC.CFGAIO2.MODE32** = 00b to use AIO3 and AIO2 as digital inputs.

23.4.3.1. AIO2 IO

Set **SOC.CFGAIO2.OPT2** = 00b to use AIO2 as input. The input state can be read at **SOC.DINSIG0.AIO2DIN**.

Set **SOC.CFGAIO2.OPT2** = 10b to use AIO2 as open drain output. Set **SOC.CFGAIO2.MUX2** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO2DOUT**. Use **SOC.CFGAIO2.MUX2** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.4.3.2. AIO3 IO

Set **SOC.CFGAIO3.OPT3** = 00b to use AIO3 as input. The input state can be read at **SOC.DINSIG0.AIO3DIN**.

Set **SOC.CFGAIO3.OPT3** = 10b to use AIO3 as open drain output. Set **SOC.CFGAIO3.MUX3** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO3DOUT**. Use **SOC.CFGAIO3.MUX3** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.4.3.3. AIO2 Polarity

Use **SOC.CFGAIO2.POL2** to set logic polarity of the signal between AIO2 input/output and MUX2.

23.4.3.4. AIO3 Polarity

Use **SOC.CFGAIO3.POL3** to set logic polarity of the signal between AIO3 input/output and MUX3.

23.4.4. AIO3, AIO2 differential Amplifier Mode DAO32

Set **SOC.CFGAIO2.MODE32** = 01b to use AIO3 and AIO2 as input to a differential amplifier DAO32.

23.4.4.1. DAO32 Differential Amplifier Gain

Use **SOC.CFGAIO2.GAIN32** to set to gain between 1x to 48x.

23.4.4.2. DAO32 Differential Amplifier Reference

Use **SOC.CFGAIO3.OS32EN** to set the amplifier reference either VSSA or VREF/2.

23.4.4.3. DAO32 Differential Amplifier Calibration

Use **SOC.CFGAIO3.CAL32EN** to short the input of the differential amplifier to allow reading of the amplifier offset.

23.4.5. AIO3, AIO2 Protection

In **SOC.CFGAIO2.MODE32** = 01b differential amplifier mode, a high side comparator protector HP10 and a low

side comparator protector LP10 are also active that can be configured to disabled high-side or low-side drivers in the application specific power driver section.

23.4.5.1. HP32 Comparator

The HP32 comparator takes the AIO3 voltage referenced to VSSA and compares it against the HP-DAC voltage. The 8-bit HP-DAC is programmable with **SOC.HPDAC**.

Use **SOC.CFGAIO3.HP32EN** to enable HP32 comparator with different blanking times.

Use **SOC.SIGSET.HPPROTHYS** to enable HP32 comparator hysteresis.

The output of HP32 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO3.HP32PR1EN** or protection signal PR2 using **SOC.CFGAIO3.HP32PR2EN**.

The output of HP32 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.HP32INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.HP32INT**.

23.4.5.2. LP32 Comparator

The LP32 comparator takes the output of the differential amplifier and compares it against the LP-DAC voltage. The 10-bit LP-DAC is programmable with **SOC.LPDAC0** and **SOC.LPDAC1**.

Use **SOC.CFGAIO2.LP32EN** to enable LP32 comparator with different blanking times.

Use **SOC.SIGSET.LPPROTHYS** to enable LP32 comparator hysteresis.

The output of LP32 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO3.LP32PR1EN** or protection signal PR2 using **SOC.CFGAIO3.LP32PR2EN**.

The output of LP32 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.LP32INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.LP32INT**.

23.5.3.1. AIO4 IO

Set **SOC.CFGAIO4.OPT4** = 00b to use AIO4 as input. The input state can be read at **SOC.DINSIG0.AIO4DIN**.

Set **SOC.CFGAIO4.OPT4** = 10b to use AIO4 as open drain output. Set **SOC.CFGAIO4.MUX4** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO4DOUT**. Use **SOC.CFGAIO4.MUX4** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.5.3.2. AIO5 IO

Set **SOC.CFGAIO5.OPT5** = 00b to use AIO5 as input. The input state can be read at **SOC.DINSIG0.AIO5DIN**.

Set **SOC.CFGAIO5.OPT5** = 10b to use AIO5 as open drain output. Set **SOC.CFGAIO5.MUX5** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO5DOUT**. Use **SOC.CFGAIO5.MUX5** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.5.3.3. AIO4 Polarity

Use **SOC.CFGAIO4.POL4** to set logic polarity of the signal between AIO4 input/output and MUX4.

23.5.3.4. AIO5 Polarity

Use **SOC.CFGAIO5.POL5** to set logic polarity of the signal between AIO5 input/output and MUX5.

23.5.4. AIO5, AIO4 differential Amplifier Mode DAO54

Set **SOC.CFGAIO4.MODE54** = 01b to use AIO5 and AIO4 as input to a differential amplifier DAO54.

23.5.4.1. DAO54 Differential Amplifier Gain

Use **SOC.CFGAIO4.GAIN54** to set to gain between 1x to 48x.

23.5.4.2. DAO54 Differential Amplifier Reference

Use **SOC.CFGAIO5.OS54EN** to set the amplifier reference either VSSA or VREF/2.

23.5.4.3. DAO54 Differential Amplifier Calibration

Use **SOC.CFGAIO5.CAL54EN** to short the input of the differential amplifier to allow reading of the amplifier offset.

23.5.5. AIO5, AIO4 Protection

In **SOC.CFGAIO4.MODE54** = 01b differential amplifier mode, a high side comparator protector HP54 and a low

side comparator protector LP54 are also active that can be configured to disabled high-side or low-side drivers in the application specific power driver section.

23.5.5.1. HP54 Comparator

The HP54 comparator takes the AIO5 voltage referenced to VSSA and compares it against the HP-DAC voltage. The 8-bit HP-DAC is programmable with **SOC.HPDAC**.

Use **SOC.CFGAIO5.HP54EN** to enable HP54 comparator with different blanking times.

Use **SOC.SIGSET.HPPROTHYS** to enable HP54 comparator hysteresis.

The output of HP54 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO5.HP54PR1EN** or protection signal PR2 using **SOC.CFGAIO5.HP54PR2EN**.

The output of HP54 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.HP54INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.HP54INT**.

23.5.5.2. LP54 Comparator

The LP54 comparator takes the output of the differential amplifier and compares it against the LP-DAC voltage. The 10-bit LP-DAC is programmable with **SOC.LPDAC0** and **SOC.LPDAC1**.

Use **SOC.CFGAIO4.LP54EN** to enable LP54 comparator with different blanking times.

Use **SOC.SIGSET.LPPROTHYS** to enable LP54 comparator hysteresis.

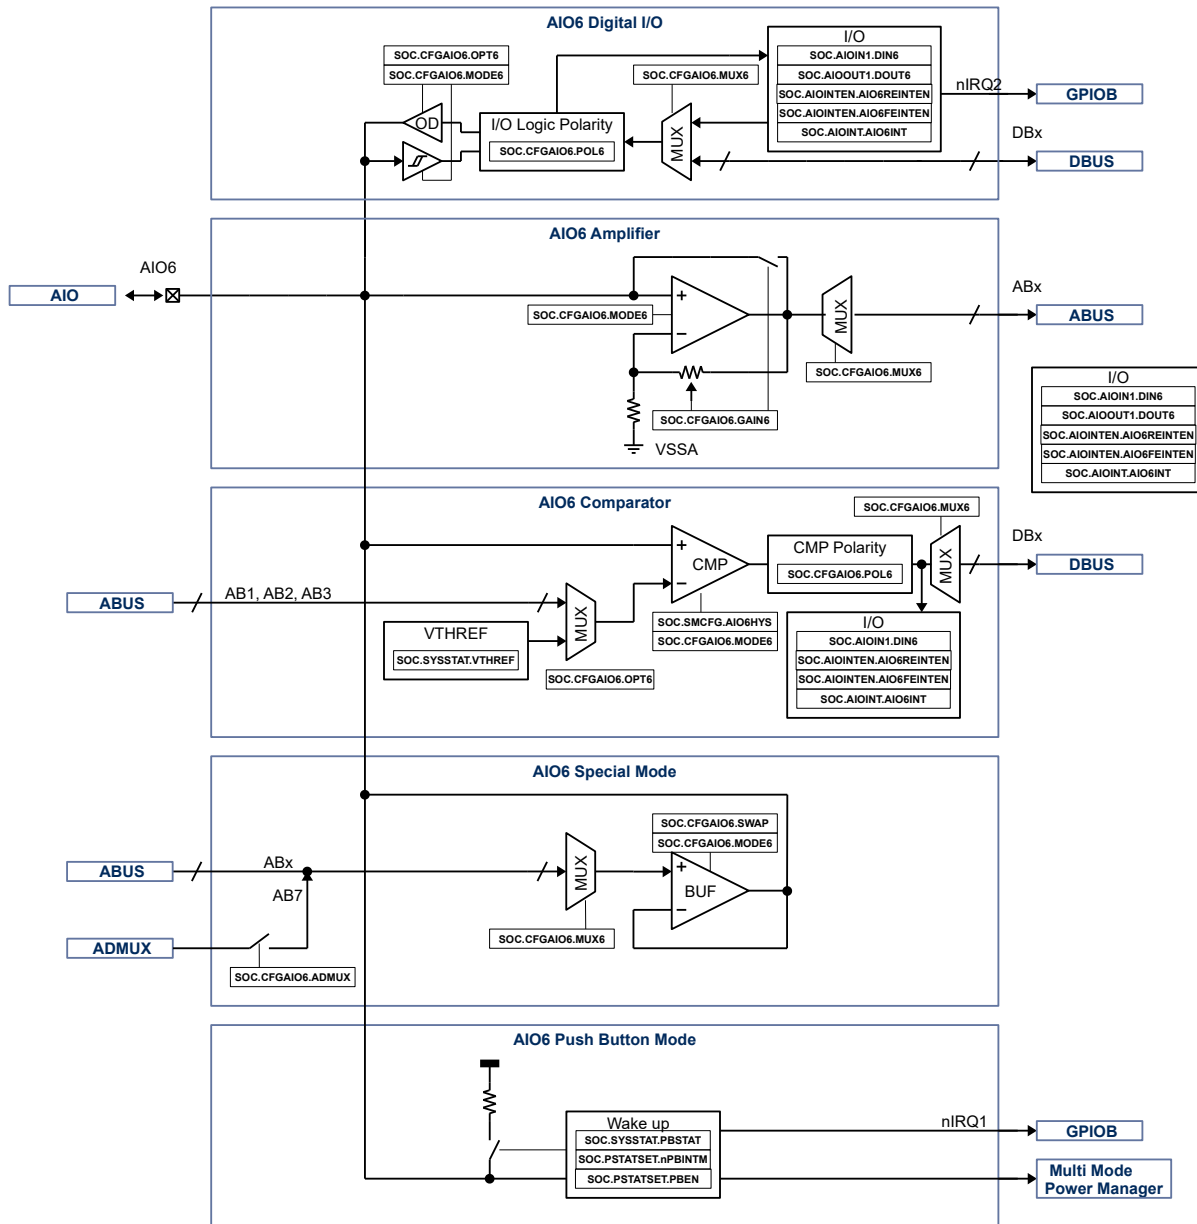

The output of LP54 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO5.LP54PR1EN** or protection signal PR2 using **SOC.CFGAIO5.LP54PR2EN**.

The output of LP54 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.LP54INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.LP54INT**.

23.6. AIO6

23.6.1. Block Diagram

Figure 23-5. AIO6

23.6.2. AIO6

AIO6 can be configured as digital input, as singled ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.6.3. AIO6 digital I/O Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 00b to use AIO6 as digital IO.

23.6.3.1. AIO6 IO

Set **SOC.CFGAIO6.OPT6** = 00b to use AIO6 as input. The input state can be read at **SOC.DINSIG1.AIO6DIN**.

Set **SOC.CFGAIO6.OPT6** = 10b to use AIO6 as open drain output. Set **SOC.CFGAIO6.MUX6** = 00b to MUX the output state from **SOC.DOUTSIG1.AIO6DOUT**. Use **SOC.CFGAIO6.MUX6** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.6.3.2. AIO6 IO Interrupt

Set **SOC.SIGINTM.AIO6REINTEN** to allow nIRQ2 interrupt on AIO6 low high transition.

Set **SOC.SIGINTM.AIO6FEINTEN** to allow nIRQ2 interrupt on AIO6 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO6INT** and cleared by writing **SOC.SIGINTF.AIO6INT** to 1b.

23.6.3.3. AIO6 Polarity

Use **SOC.CFGAIO6.POL6** to set logic polarity of the signal between AIO6 input/output and MUX6.

23.6.4. AIO6 Single Ended Amplifier Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 01b to use AIO6 as input to a programmable gain amplifier.

23.6.4.1. AIO6 Amplifier Gain

Use **SOC.CFGAIO6.GAIN6** to set to gain between 1x to 48x or bidirectional amplifier bypassmode.

23.6.4.2. AIO6 Analog MUX

Use **SOC.CFGAIO6.MUX6** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.6.5. AIO6 Comparator Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 10b to use AIO6 in comparator mode.

23.6.5.1. AIO6 Comparator Hysteresis

Use **SOC.SIGSET.AIO6HYS** to enable AIO6 comparator hysteresis.

23.6.5.2. AIO6 Comparator setting

Use **SOC.CFGAIO6.OPT6** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.6.5.3. AIO6 Comparator Polarity

Use **SOC.CFGAIO6.POL6** to set the output polarity of the comparator.

23.6.5.4. AIO6 Comparator Output MUX

Use **SOC.AIO6CFG.MUX6** to set the output of the comparator to the digital bus DB1 to DB7 or **SOC.AIOIN1.AIO6DIN**.

23.6.6. AIO6 Special Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 11b to use AIO6 in special mode. In special mode the AIO6 can output a buffered signal from the internal ABUS, AB1 to AB7.

23.6.6.1. AIO6 Special Mode MUX

Use **SOC.CFGAIO6.MUX6** to set the ABx channel output to AIO6.

23.6.6.2. AIO6 Special Mode ADMUX

Use **SOC.CFGAIO6.ADMUX** set the MUX the ADMUX output to AB7.

23.6.6.3. AIO6 Special Mode OFFSET SWAP

Use **SOC.CFGAIO6.SWAP** to swap the random offset of the buffer for calibration reasons.

23.6.7. AIO6 Push Button Mode

Set **SOC.PSTATSET.PBEN** = 1b to enable AIO6 Hibernate push button mode, where AIO6 has an internal weak pull up also active in hibernate mode. Set **SOC.PSTATSET.nPBINTM** = 1b to enable nIRQ1 interrupt. Use **SOC.SYSSTAT.PBSTAT** to monitor interrupt status and write 1b to clear interrupt.

23.6.7.1. AIO6 Push Button Wake Up

In Hibernate Wake Mode and enabled push button mode, if AIO6 is pulled low for the de-bouncing time period, the **SOC.PWRCTL.HIB** is cleared and the device powers up.

23.6.7.2. AIO6 Push Button Power Down

In normal mode the **SOC.SYSSTAT.PBSTAT** is set when AIO6 is pulled low for the de-bouncing time period. The system then can be put into hibernate mode by setting **SOC.PWRCTL.HIB** = 1b.

23.6.7.3. AIO6 Push Button Hard Reset

In normal operation if the AIO6 is pulled low for more than 8s, the nRST signal will be asserted and the MCU is reset. **SOC.PWRSTAT.HWRESET** is set to indicate this condition.

23.7. AIO7

23.7.1. Block Diagram

Figure 23-6. AIO7

23.7.2. AIO7

AIO7 can be configured as digital input, as singled ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.7.3. AIO7 Digital I/O Mode

Set **SOC.CFGAIO7.MODE7** = 00b to use AIO7 as digital IO. To use AIO7 as a digital input, set

SOC.CFGAIO7.OPT7 to 00b. The input state can be read at **SOC.DINSIG1.DIN7**.

Set **SOC.CFGAIO7.OPT7** = 10b to use AIO7 as open drain output. Set **SOC.CFGAIO7.MUX7** = 00b to MUX the output state from **SOC.DOUTSIG1.DOUT7**. Use **SOC.CFGAIO7.MUX7** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

Set **SOC.SIGINTM.AIO7FEINTEN** to allow nIRQ2 interrupt on AIO7 high to low transition.

Set **SOC.SIGINTM.AIO7REINTEN** to allow nIRQ2 interrupt on AIO7 low to low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO7INT** and cleared by writing **SOC.SIGINTF.AIO7INT** to 1b.

Use **SOC.CFGAIO7.POL7** to set logic polarity of the signal between AIO7 input/output and MUX7.

23.7.4. AIO7 Gain Amplifier Mode

To configure AIO7 for gain amplifier mode, set **SOC.CFGAIO7.MODE7** to 01b.

In this mode, the gain of the amplifier can be set between 1X and 48X. To set the gain, set **SOC.CFGAIO7.GAIN7** to the desired value. To switch the output of the amplifier to analog channel AB1 to AB7 on ABUS, set **SOC.CFGAIO7.MUX7** to the desired channel.

23.7.5. AIO7 Comparator Mode

To configure AIO7 for comparator mode, set **SOC.CFGAIO7.MODE7** = 10b.

To set the AIO7 comparator reference, set **SOC.CFGAIO7.OPT7** to AB1, AB2, AB3 or VTHREF. The VTHREF value can be set using **SOC.SYSSTAT.VTHREF**.

The output polarity of the AIO7 comparator may be set by using **SOC.CFGAIO7.POL7** to the desired value.

The output of the comparator may be configured by setting **SOC.CFGAIO7.MUX7** to the desired value. The output can be set to AB1 to AB7 or to **SOC.AIOIN1.DIN7**.

23.7.6. AIO7 Special Mode

In special mode, the AIO7 comparator is enabled. To configure AIO7 for special mode, set **SOC.CFGAIO7.MODE7** to 11b.

In special mode, AIO7 allows the user to configure bi-directional asymmetric comparator hysteresis. See the section below for more information.

The user may set the AIO7 comparator input to AB1, AB2, AB3 or VTHREF. the user may also use the comparator for phase to phase comparisons by setting the comparator input to AIO8 or AIO9. The user may configure the comparator input by setting **SOC.CFGAIO7.OPT7** to the desired value.

In special mode, AIO7 allows the user to configure the comparator star point.

Set **CFGAI09.MODE9[0]** to 1b to connect AIO7, AIO8 and AIO9 to AB1 with a 100kOhm resistor to create a star point reference for the comparator.

Set **CFGAI09.MODE9[0]** to 0b to set the AB1 reference to come from AIO6 in amplifier mode. To set AIO6 to amplifier mode, set **CFGAI06.MODE6** to 01b and **CFGAI06.GAIN6** to 000b for direct mode, and **CFGAI06.MUX6** to 1b.

To read the voltage on AIO7, set **CFGAI09.MODE9[1]** to 1b. This setting will MUX AIO7 to AB7 with 40% attenuation so the ADC can read the AIO7 voltage.

To read the comparator output for AIO7, AIO8 or AIO9 for position (POS), set **CFGAI09.OPT9** to the desired value.

The AIO7 Sample and Hold (S/H) bypass may be configured as well. To bypass the POS S/H, set **CFGAI08.OPT8[1]** to 0b. To use POS S/H for use with the EMUX, set **CFGAI08.OPT8[0]** to the 1b.

To select the POS or nIRQ2 output, set the **CFGAI08.OPT8[0]** to the desired value.

When configured in special mode, the user may select the comparator input using a MUX by writing the **CFGAI07.MUX7** field. The table below shows the comparator input selections that may be used.

Table 23-2. AIO7 Special Mode Comparator Input Selections

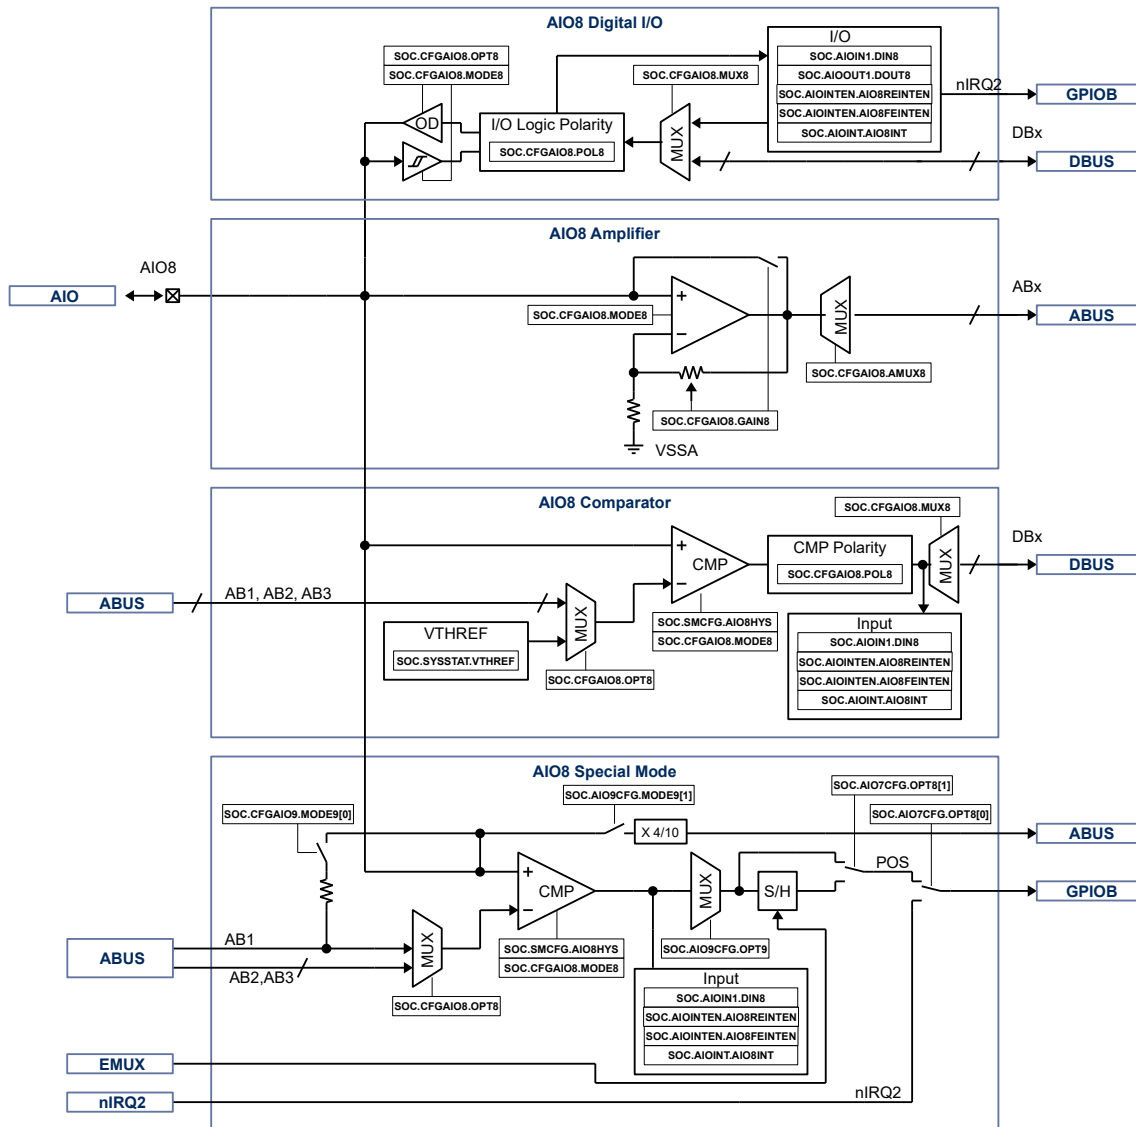

| CFGAI07.MODE | AIO Mode | CFGAI07.MUX | Comparator Input MUX Selection | Function |
|--------------|--------------|-------------|--------------------------------|--|
| 11b | Special Mode | 000b | VTHREF | Fixed threshold |
| | | 001b | AB1 | Virtual center-tap for BEMF zero-cross |
| | | 010b | AB2 | |
| | | 011b | AB3 | |
| | | 100b | AIO8 | Phase to phase |
| | | 101b | AIO9 | Phase to phase |
| | | 110b | RFU | |
| | | 111b | RFU | |

The user may configure the comparator hysteresis separately for rising and falling hysteresis as shown in **SOC.SPECCFG1**.

23.8. AIO8

23.8.1. Block Diagram

Figure 23-7. AIO8

23.8.2. AIO8

AIO8 can be configured as digital input, as singled ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.8.3. AIO8 digital I/O Mode

Set **SOC.CFGAIO8.MODE8** = 00b to use AIO8 as digital IO.

23.8.3.1. AIO8 IO

Set **SOC.CFGAIO8.OPT8** = 00b to use AIO8 as input. The input state can be read at **SOC.DINSIG0.AIO8DIN**.

Set **SOC.CFGAIO8.OPT8** = 10b to use AIO8 as open drain output. Set **SOC.CFGAIO8.MUX8** = 00b to MUX the output state from **SOC.DCOUTSIG0.AIO8DOUT**. Use **SOC.CFGAIO8.MUX8** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.8.3.2. AIO8 IO Interrupt

Set **SOC.SIGINTM.AIO8REINTEN** to allow nIRQ2 interrupt on AIO8 low high transition.

Set **SOC.SIGINTM.AIO8FEINTEN** to allow nIRQ2 interrupt on AIO8 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO8INT** and cleared by writing **SOC.SIGINTF.AIO8INT** to 1b.

23.8.3.3. AIO8 Polarity

Use **SOC.CFGAIO8.POL8** to set logic polarity of the signal between AIO8 input/output and MUX8.

23.8.4. AIO8 Single Ended Amplifier Mode

Set **SOC.CFGAIO8.MODE8** = 01b to use AIO8 as input to a programmable gain amplifier.

23.8.4.1. AIO8 Amplifier Gain

Use **SOC.CFGAIO8.GAIN8** to set to gain between 1x to 48x or bidirectional amplifier bypass mode.

23.8.4.2. AIO8 Analog MUX

Use **SOC.CFGAIO8.MUX8** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.8.5. AIO8 Comparator Mode

Set **SOC.CFGAIO8.MODE8** = 10b to use AIO8 in comparator mode.

23.8.5.1. AIO8 Comparator Hysteresis

Use **SOC.SIGSET.AIO8HYS** to enable AIO8 comparator hysteresis.

23.8.5.2. AIO8 Comparator Reference

Use **SOC.CFGAIO8.OPT8** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.8.5.3. AIO8 Comparator Polarity

Use **SOC.CFGAIO8.POL8** to set the output polarity of the comparator.

23.8.5.4. AIO8 Comparator Output

The comparator output can be observed with **SOC.DINSIG1.AIO8DIN**.

23.8.6. AIO8 Special Mode

Set **SOC.CFGAIO7.MODE7** = 11b to use AIO8 in special mode. In special mode the AIO8 comparator is enabled.

23.8.6.1. AIO8 Comparator Hysteresis

Use **SOC.SIGSET.AIO8HYS** to enable AIO8 comparator hysteresis.

23.8.6.2. AIO8 Comparator Reference

Use **SOC.CFGAIO7.OPT7** to set the compare value of the comparator to AB1, AB2 or AB3.

23.8.6.3. AIO8 Comparator Reference Star Point

Use **SOC.CFGAIO9.MODE9[0]** = 1b to connect AIO7, AIO8 and AIO9 to AB1 with a 100kOhm resistor to create a star point reference for the comparator.

With **SOC.CFGAIO9.MODE9[0]** = 0b, the AB1 reference could for example come from AIO6 in amplifier mode **SOC.CFGAIO6.MODE6** = 01b and **SOC.CFGAIO6.GAIN6** = 000b direct mode and **SOC.CFGAIO6.MUX6** = 1b.

23.8.6.4. AIO8 Voltage Reading

Use **SOC.CFGAIO9.MODE9[1]** = 1b to MUX AIO8 to AB8 with 40% attenuation, so ADC can read out AIO8 voltage.

23.8.6.5. AIO8 Comparator Output

Use **SOC.CFGAIO9.OPT9** to select AIO7, AIO8 or AIO9 comparator output signal for POS.

23.8.6.6. AIO8 POS S/H Bypass

Set **SOC.CFGAIO8.OPT8[1]** =0b bypass the POS S/H.

Set **SOC.CFGAIO8.OPT8[1]** =1b use POS S/H for use with EMUX.

23.8.6.7. AIO8 nIRQ2/POS Selector

Use **SOC.CFGAIO8.OPT8[0]** to select POS or nIRQ2 output.

23.9. AIO9

23.9.1. Block Diagram

Figure 23-8. AIO9

23.9.2. AIO9

AIO9 can be configured as digital input, as singled ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.9.3. AIO9 digital I/O Mode

Set **SOC.CFGAIO9.MODE9** = 00b to use AIO9 as digital IO.

23.9.3.1. AIO9 IO

Set **SOC.CFGAIO9.OPT9** = 00b to use AIO9 as input. The input state can be read at **SOC.DINSIG1.AIO9DIN**.

Set **SOC.CFGAIO9.OPT9** = 10b to use AIO9 as open drain output. Set **SOC.CFGAIO9.MUX9** = 00b to MUX the output state from **SOC.DOUTSIG1.AIO9DOUT**. Use **SOC.CFGAIO9.MUX9** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.9.3.2. AIO9 IO Interrupt

Set **SOC.SIGINTM.AIO9REINTEN** to allow nIRQ2 interrupt on AIO8 low high transition.

Set **SOC.SIGINTM.AIO9FEINTEN** to allow nIRQ2 interrupt on AIO8 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO9INT** and cleared by writing **SOC.SIGINTF.AIO9INT** to 1b.

23.9.3.3. AIO9 Polarity

Use **SOC.CFGAIO9.POL9** to set logic polarity of the signal between AIO9 input/output and MUX9.

23.9.4. AIO9 Single Ended Amplifier Mode

Set **SOC.CFGAIO9.MODE9** = 01b to use AIO9 as input to a programmable gain amplifier.

23.9.4.1. AIO9 Amplifier Gain

Use **SOC.CFGAIO9.GAIN9** to set to gain between 1x to 48x or bidirectional amplifier bypass mode.

23.9.4.2. AIO9 Analog MUX

Use **SOC.CFGAIO9.MUX9** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.9.5. AIO9 Comparator Mode

Set **SOC.CFGAIO9.MODE9** = 10b to use AIO9 in comparator mode.

23.9.5.1. AIO9 Comparator Hysteresis

Use **SOC.SIGSET.AIO9HYS** to enable AIO9 comparator hysteresis.

23.9.5.2. AIO9 Comparator Reference

Use **SOC.CFGAIO9.OPT9** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.9.5.3. AIO9 Comparator Polarity

Use **SOC.CFGAIO9.POL9** to set the output polarity of the comparator.

23.9.5.4. AIO9 Comparator Output

The comparator output can be observed with **SOC.DINSIG1.AIO9DIN**.

23.9.6. AIO9 Special Mode

Set **SOC.CFGAIO7.MODE7** = 11b to use AIO9 in special mode. In special mode the AIO9 comparator is enabled.

23.9.6.1. AIO9 Comparator Hysteresis

Use **SOC.SIGSET.AIO9HYS** to enable AIO9 comparator hysteresis.

23.9.6.2. AIO9 Comparator Reference

Use **SOC.CFGAIO7.OPT7** to set the compare value of the comparator to AB1, AB2 or AB3.

23.9.6.3. AIO9 Comparator Reference Star Point

Use **SOC.CFGAIO9.MODE9[0]** = 1b to connect AIO7, AIO8 and AIO9 to AB1 with a 100kOhm resistor to create a star point reference for the comparator.

With **SOC.CFGAIO9.MODE9[0]** = 0b, the AB1 reference could for example come from AIO6 in amplifier mode **SOC.CFGAIO6.MODE6** = 01b and **SOC.CFGAIO6.GAIN6** = 000b direct mode and **SOC.CFGAIO6.MUX6** = 1b.

23.9.6.4. AIO9 Voltage Reading

Use **SOC.CFGAIO9.MODE9[1]** = 1b to MUX AIO9 to AB9 with 40% attenuation, so ADC can read out AIO9 voltage.

23.9.6.5. AIO9 Comparator Output

Use **SOC.CFGAIO9.OPT9** to select AIO7, AIO8 or AIO9 comparator output signal for POS.

23.9.6.6. AIO9 POS S/H Bypass

Set **SOC.CFGAIO8.OPT8[1]** =0b bypass the POS S/H.

Set **SOC.CFGAIO8.OPT8[1]** =1b use POS S/H for use with EMUX.

23.9.6.7. AIO9 nIRQ2/POS Selector

Use **SOC.CFGAIO8.OPT8[0]** to select POS or nIRQ2 output.

24. EMUX

The EMUX is a dedicated high-speed, low-latency serial interface to control the ADMUX, AIO7, AIO8, AIO9 POS sample and hold and the DAOxy sample and hold using the ADC sequencing engine.

To enable the EMUX, set the **SOC.ADCSCAN.SCANEN** = 1b. This will enable the ADC sequencer to command the control of the AFE MUX using the EMUX data sent by the sequencer.

The EMUX allows high-speed control over the following:

- AFE MUX channel select
- DAO10, DAO32 and DAO54 sample and hold engines
- POS/BEMF sample and hold engine

The format of the EMUX command used to control the AFE MUX is the same as shown in **SOC.ADCIN1**. The EMUX data is transmitted MSB first.

Table 24-1. EMUX Packet Structure

| BIT | NAME | DESCRIPTION |
|-----|-------------|--|
| 7:6 | C | EMUX start of message token. |
| 5 | SH1 | Sample and hold activation for phase comparators 0b: Sample 1b: Hold |
| 4 | SH2 | Sample and hold activation for Differential Amplifiers: DAO10, DAO32 and DAO54 0b: Sample 1b: Hold |
| 3:0 | MUXA | AFE MUX Channel Selector: 0000b: DAO10 0001b: DAO32 0010b: DAO54 0011b: AB1 0100b: AB2 0101b: AB3 0110b: AB4 0111b: AB5 1000b: AB6 1001b: AB7 1010b: AB8 1011b: AB9 1100b: AB10 1101b: AB11 1110b: AB12 1111b: VREF * 5/10 |

The BEMF POS sample and hold circuits are toggled based on the SH1 bit in the EMUX packet with the falling edge of the 3rd clock cycle.

The AIO54, AIO32 and AIO10 sample and hold circuits are toggled based on the SH2 bit in the EMUX packet with the falling edge of the 4th clock cycle.

The AFE MUX select is switched with the falling edge of the 8th clock based on the data bits 3:0 of the EMUX data.

Figure 24-1. EMUX Timing Diagram

25. APPLICATION SPECIFIC POWER DRIVER

25.1. Register

25.1.1. Register Map

Table 25-1. Application Specific Power Driver Register Map

| SOC ADDRESS | NAME | DESCRIPTION | RESET VALUE |

25.2. Details of Operation

25.2.1. Block Diagram

Figure 25-1. Application Specific Power Driver

25.2.2. Configuration

Following blocks need to be configured for correct use of the Application specific power driver

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- SOC Bridge

25.2.3. Application Specific Power Driver

The application specific power driver registers are accessible through the SOC Bridge. high side drivers DRHx, low side drivers DRLx can be controlled by timer PWMs.

The CLKOUT low-speed clock output may be controlled by registers through the SOC Bridge as well.

25.2.3.1. Application Specific Power Driver Enable

Use **SOC.DRVCTL.ENDRV** to enable the application specific power driver.

25.2.3.2. Break Before Make Enable

This device contains a break before make function, which enforces that the low-side and high-side gate drivers for the same half-bridge are not enabled at the same time.

To enable this function, set **SOC.ENBBM.ENBBM** to 1b to enforce this behavior for the high-side and low-side driver pairs: DRL0-DRH3, DRL1-DRH4 and DRL2-DRH5.

25.2.3.3. Low-speed Clock Output

The device contains a low-speed clock output (CLKOUT). This clock output is a 5V, 50% duty cycle digital signal. The clock output has an independent clock source and may be used by applications that require a low-speed clock, such as UL 60730 Class B Safety.

This output clock is disabled by default (**SOC.CFGDRQ6.ENCLKOUT** = 0b) and may be enabled or disabled by setting the **SOC.CFGDRQ6.ENCLKOUT** bit to 1b.

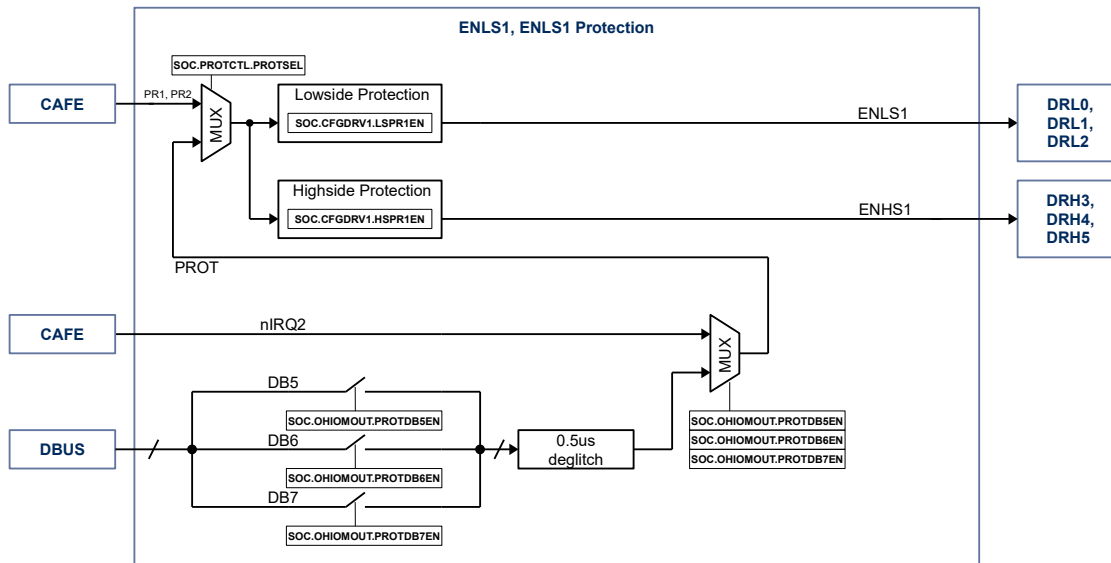

The frequency of the clock may be configured by setting the **SOC.CFGDRQ6.MUX6** field as shown below:

- 010b: 1.16kHz
- 001b: 580Hz

25.3. ENHS1, ENLS1 Protection

25.3.1. Block Diagram

Figure 25-2. ENHS1, ENLS1 Protection

25.3.2. ENHS1, ENLS1 Protection

The PR1, PR2 signals from the AIOx inputs in the configurable analog front-end can be used to disable the gate drivers in the application specific power drivers, separated in 2 groups.

The ENHS1 signal protects DRH3, DRH4, DRH5.

The ENLS1 signal protects DRS3, DRS4, DRS5.

25.3.2.1. ENLS1 Protection Enable

Use **SOC.DRV1CFG.LSPR1EN** to enable protection signal ENLS1 using PR1 as input.

Use **SOC.DRV1CFG.LSPR2EN** to enable protection signal ENLS1 using PR2 as input.

25.3.2.2. ENHS1 Protection Enable

Use **SOC.DRV1CFG.LSPR1EN** to enable protection signal ENHS1 using PR1 as input.

Use **SOC.DRV1CFG.LSPR2EN** to enable protection signal ENHS1 using PR2 as input.

25.3.2.3. Input Signal Selection

Use **SOC.PROTCTL.PROTSEL** to select between PR1 or PROT signal as the input to ENHS1, ENLS1 protection signals.

Use **SOC.OHIOMOUT.PROTDB5EN**, **SOC.OHIOMOUT.PROTDB6EN**, and **SOC.OHIOMOUT.PROTDB7EN** to

select the input signal for this protection function.

25.4. DRL0 Low Side Driver

25.4.1. Block Diagram

Figure 25-3. DRL0

25.4.2. DRL0

DRL0 is a push-pull low side gate driver, controlled by PA0 I/O. The gate driver has configurable propagation delay, global driver enable, configurable make before break with DRH3 and configurable protection disable with ENLS1 protection

25.4.2.1. DRL0 Propagation Delay

Use **SOC.DRVCFG0** to set the propagation delay between PA0 input and DRL0 output between 0ns to 200ns.

25.4.2.2. DRL0 Enable

The DRL0 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENLS1 will disabled the driver if configured.

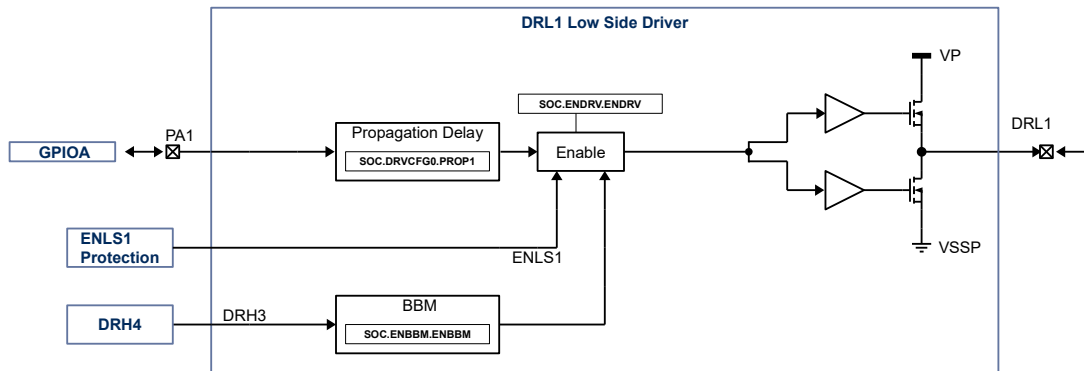

25.4.2.3. Break Before Make Control

Use **SOC.ENBBM.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

25.5. DRL1 Low Side Driver

25.5.1. Block Diagram

Figure 25-4. DRL1

25.5.2. DRL1

DRL1 is a push-pull low side gate driver, controlled by PA1 I/O. The gate driver has configurable propagation delay, global driver enable, configurable make before break with DRH4 and configurable protection disable with ENLS1 protection

25.5.2.1. DRL1 Propagation Delay

Use **SOC.DRVCFG0.PROP1** to set the propagation delay between PA1 I/O and DRL1 output between 0ns to 200ns.

25.5.2.2. DRL1 Enable

The DRL1 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENLS1 will disabled the driver if configured.

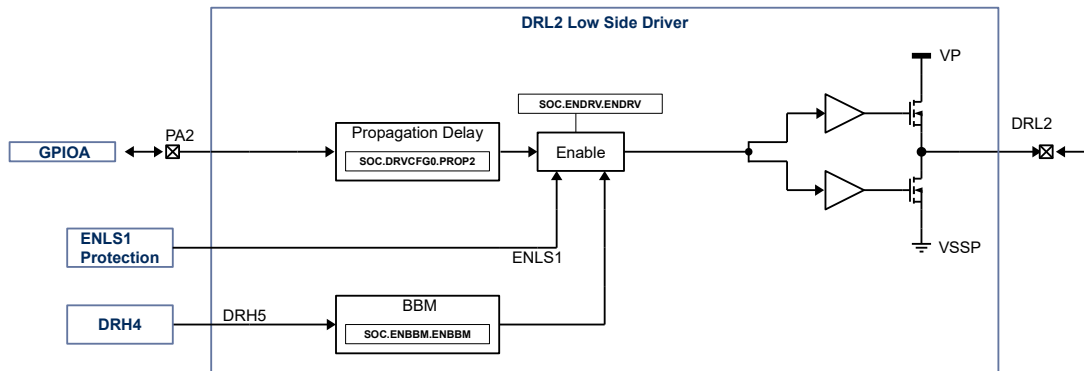

25.5.2.3. Break Before Make Control

Use **SOC.ENBBM.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

25.6. DRL2 Low Side Driver

25.6.1. Block Diagram

Figure 25-5. DRL2

25.6.2. DRL2

DRL2 is a push-pull low side gate driver, controlled by PA2 I/O. The gate driver has configurable propagation delay, global driver enable, configurable make before break with DRH5 and configurable protection disable with ENLS1 protection

25.6.2.1. DRL2 Propagation Delay

Use **SOC.DRVCFG0.PROP2** to set the propagation delay between PA2 I/O and DRL2 output between 0ns to 200ns.

25.6.2.2. DRL2 Enable

The DRL2 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENLS1 will disabled the driver if configured.

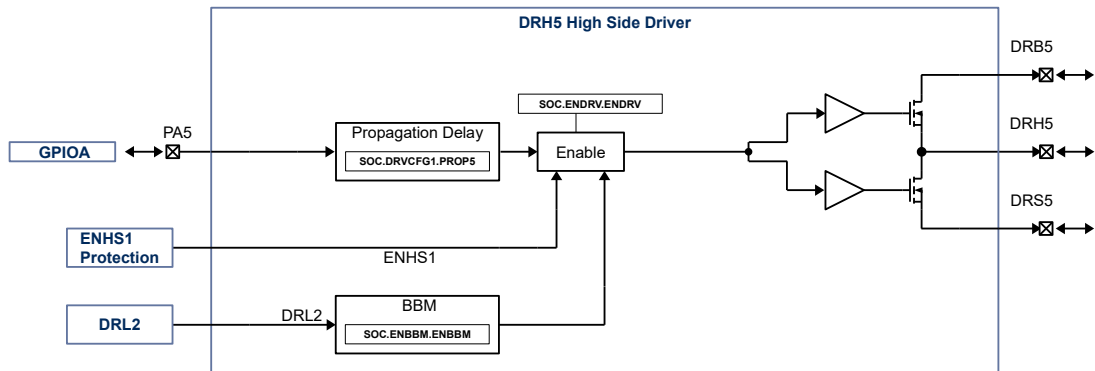

25.6.2.3. Break Before Make Control

Use **SOC.ENBBM.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

25.7. DRH3 High Side Driver

25.7.1. Block Diagram

Figure 25-6. DRH3

25.7.2. DRH3

DRH3 is a push-pull high side gate driver, controlled by PA3 I/O. The gate driver has configurable propagation delay, global driver enable, configurable make before break with DRL0 and configurable protection disable with ENHS1 signal from the configurable analog front end.

The DRH3 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENHS1 will disabled the driver if configured.

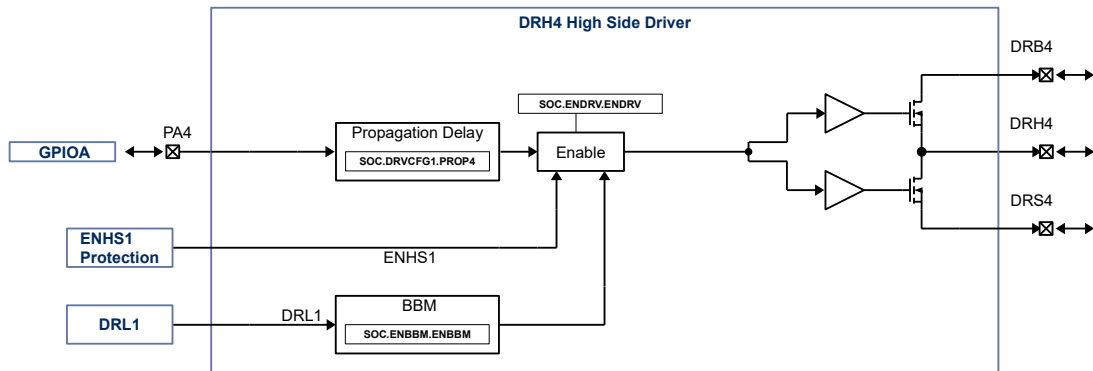

Use **SOC.DRVCFG.PROP3** to set the propagation delay between PA3 I/O and DRH3 output between 0ns to 200ns.

Use **SOC.ENBBM.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

25.8. DRH4 High Side Driver

25.8.1. Block Diagram

Figure 25-7. DRH4

25.8.2. DRH4

DRH4 is a push-pull high side gate driver, controlled by PA4 I/O. The gate driver has configurable propagation delay, global driver enable, configurable make before break with DRL2 and configurable protection disable with ENHS1 signal from the configurable analog front end.

25.8.2.1. DRH4 Propagation Delay

Use **SOC.DRVCFG1.PROP4** to set the propagation delay between PA4 I/O and DRH4 output between 0ns to 200ns.

25.8.2.2. DRH4 Enable

The DRH4 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENHS1 will disabled the driver if configured.

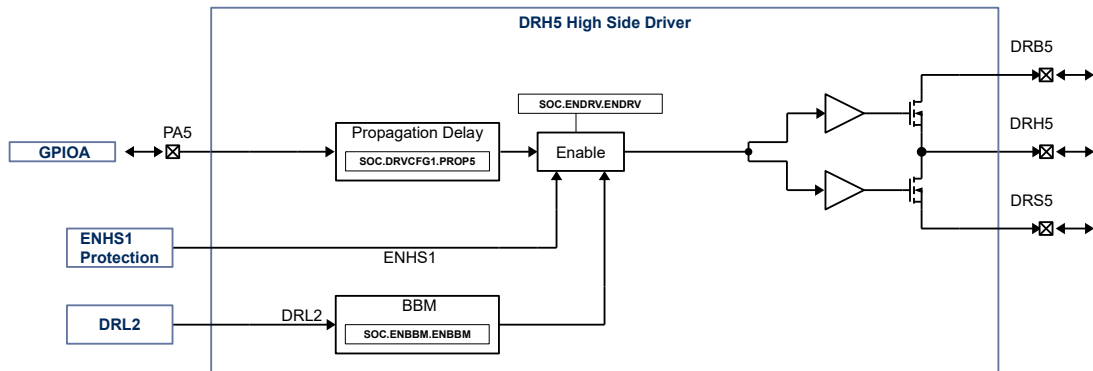

25.8.2.3. Break Before Make Control

Use **SOC.ENBBM.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

25.9. DRH5 High Side Driver

25.9.1. Block Diagram

Figure 25-8. DRH5

25.9.2. DRH5

DRH5 is a push-pull high side gate driver, controlled by PA5 I/O. The gate driver has configurable propagation delay, global driver enable, configurable make before break with DRL3 and configurable protection disable with ENHS1 signal from the configurable analog front end.

25.9.2.1. DRH5 Propagation Delay

Use **SOC.DRVCFG1.PROP5** to set the propagation delay between PA5 I/O and DRH5 output between 0ns to 200ns.

25.9.2.2. DRH5 Enable

The DRH5 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENHS1 will disabled the driver if configured

25.9.2.3. Break Before Make Control

Use **SOC.ENBBM.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

26. ARM CORTEX-M0 REFERENCE

26.1. Introduction

26.1.1. Overview

This chapter is taken from the ARM Cortex-M0 User Guide with minimal modifications made to account for the specific Cortex-M0 implementation.

26.1.2. About the Cortex-M0 processor and core peripherals

The Cortex™-M0 processor is an entry-level 32-bit ARM Cortex processor designed for a broad range of embedded applications. It offers significant benefits to developers, including:

- a simple architecture that is easy to learn and program
- ultra-low power, energy efficient operation
- excellent code density
- deterministic, high-performance interrupt handling
- upward compatibility with Cortex-M processor family.

Figure 26-1. Cortex-M0 implementation

The Cortex-M0 processor is built on a highly area and power optimized 32-bit processor core, with a 3-stage pipeline von Neumann architecture. The processor delivers exceptional energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier.

The Cortex-M0 processor implements the ARMv6-M architecture, which is based on the 16-bit Thumb® instruction set and includes Thumb-2 technology. This provides the exceptional performance expected of a modern 32-bit architecture, with a higher code density than other 8-bit and 16-bit microcontrollers.

The Cortex-M0 processor closely integrates a configurable Nested Vectored Interrupt Controller (NVIC), to deliver industry-leading interrupt performance. The NVIC:

- includes a non-maskable interrupt (NMI)
- provides zero jitter interrupt option
- provides four interrupt priority levels.

The tight integration of the processor core and NVIC provides fast execution of interrupt service routines (ISRs), dramatically reducing the interrupt latency. This is achieved through the hardware stacking of registers, and the ability to abandon and restart load-multiple and store-multiple operations. Interrupt handlers do not require any assembler wrapper code, removing any code overhead from the ISRs. Tail-chaining optimization also significantly reduces the overhead when switching from one ISR to another.

To optimize low-power designs, the NVIC integrates with the sleep modes, that include a deep sleep function that enables the entire device to be rapidly powered down.

26.1.2.1. System-level interface

The Cortex-M0 processor provides a single system-level interface using AMBA[®] technology to provide high speed, low latency memory accesses.

26.1.2.2. Integrated configurable debug

The Cortex-M0 processor implements a complete hardware debug solution, with extensive hardware breakpoint and watchpoint options. This provides high system visibility of the processor, memory and peripherals through a Serial Wire Debug (SWD) port that is ideal for microcontrollers and other small package devices. The device supports 4 hardware breakpoints.

26.1.2.3. Cortex-M0 processor features summary

- high code density with 32-bit performance
- tools and binary upwards compatible with Cortex-M processor family
- integrated ultra low-power sleep modes
- efficient code execution permits slower processor clock or increases sleep mode time
- single-cycle 32-bit hardware multiplier
- zero jitter interrupt handling
- extensive debug capabilities.

26.1.2.4. Cortex-M0 core peripherals

These are:

26.1.2.4.1. NVIC

The NVIC is an embedded interrupt controller that supports low latency interrupt processing.

26.1.2.4.2. System Control Block

The System Control Block (SCB) is the programmers model interface to the processor. It provides system implementation information and system control, including configuration, control, and reporting of system exceptions.

26.1.2.4.3. System timer

The system timer, SysTick, is a 24-bit count-down timer. Use this as a Real Time Operating System (RTOS) tick timer or as a simple counter.

26.2. The Cortex-M0 Processor

26.2.1. Programmers Model

This section describes the Cortex-M0 programmers model. In addition to the individual core register descriptions, it contains information about the processor modes and stacks.

26.2.1.1. Processor modes

The processor modes are:

Thread mode

Used to execute application software. The processor enters Thread mode when it comes out of reset.

Handler mode

Used to handle exceptions. The processor returns to Thread mode when it has finished all exception processing.

26.2.1.2. Stacks

The processor uses a full descending stack. This means the stack pointer indicates the last stacked item on the stack memory. When the processor pushes a new item onto the stack, it decrements the stack pointer and then writes the item to the new memory location. The processor implements two stacks, the main stack and the process stack, with independent copies of the stack pointer, see Stack Pointer in chapter 26.2.1.3.2 on page 288.

In Thread mode, the CONTROL register controls whether the processor uses the main stack or the process stack, see CONTROL register in chapter 26.2.1.3.12 on page 291. In Handler mode, the processor always uses the main stack. The options for processor operations are:

Table 26-1. Summary of processor mode and stack use options

| PROCESSOR MODE | USED TO EXECUTE | STACK USED |
|----------------|--------------------|------------------------------|
| Thread | Applications | Main stack or process stack* |
| Handler | Exception handlers | Main stack |

* See CONTROL Register in chapter 26.2.1.3.12 on page 291

26.2.1.3. Core Registers

Figure 26-2. Core Registers

Table 26-2. Core register set summary

| NAME | TYPE* | RESET VALUE | DESCRIPTION |
|----------|-------|-----------------|---|
| R0 – R12 | RW | Unknown | General Purpose Register, see chapter 26.2.1.3.1 on page 287 |
| MSP | RW | See description | Stack pointer, see chapter 26.2.1.3.2 on page 288 |
| PSP | RW | Unknown | Stack pointer, see chapter 26.2.1.3.2 on page 288 |
| LR | RW | Unknown | Link Register, see chapter 26.2.1.3.3 on page 288 |
| PC | RW | See description | Program Counter, see chapter 26.2.1.3.4 on page 288 |
| PSR | RW | Unknown ** | Program Status Register, see chapter 26.2.1.3.5 on page 288 |
| APSR | RW | Unknown | Application Program status register, see chapter 26.2.1.3.6 on page 289 |
| IPSR | RW | 0x0000 0000 | Interrupt Program status register, see chapter 26.2.1.3.7 on page 289 |
| ESPR | RW | Unknown ** | Execution Program status register, see chapter 26.2.1.3.8 on page 290 |
| PRIMASK | RW | 0x0000 0000 | Priority Mask Register, see chapter 26.2.1.3.11 on page 291 |
| CONTROL | RW | 0x0000 0000 | Control Register, see chapter 26.2.1.3.12 on page 291 |

*. Describes access type during program execution in thread mode and Handler mode. Debug access can differ.

**. Bit[24] is the T-bit and is loaded from bit[0] of the reset vector.

26.2.1.3.1. General-purpose registers

R0-R12 are 32-bit general-purpose registers for data operations.

26.2.1.3.2. Stack Pointer

The Stack Pointer (SP) is register R13. In Thread mode, bit[1] of the CONTROL register indicates the stack pointer to use:

- 0 = Main Stack Pointer (MSP). This is the reset value.
- 1 = Process Stack Pointer (PSP).

On reset, the processor loads the MSP with the value from address 0x0000 0000

26.2.1.3.3. Link Register

The Link Register (LR) is register R14. It stores the return information for subroutines, function calls, and exceptions. On reset, the LR value is Unknown.

26.2.1.3.4. Program Counter

The Program Counter (PC) is register R15. It contains the current program address. On reset, the processor loads the PC with the value of the reset vector, which is at address 0x0000 0004. Bit[0] of the value is loaded into the EPSR T-bit at reset and must be 1.

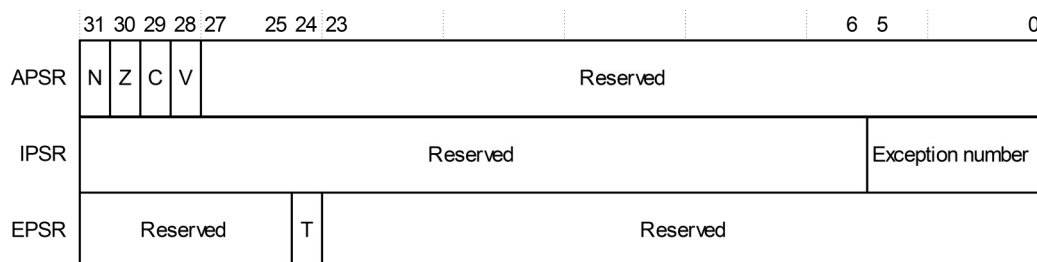

26.2.1.3.5. Program Status Register

The Program Status Register (PSR) combines:

- Application Program Status Register (APSR)
- Interrupt Program Status Register (IPSR)
- Execution Program Status Register (EPSR).

These registers are mutually exclusive bitfields in the 32-bit PSR. The PSR bit assignments are:

Figure 26-3. PSR

Access these registers individually or as a combination of any two or all three registers, using the register name as an argument to the `MSR` or `MRS` instructions. For example:

- read all of the registers using PSR with the `MRS` instruction

- write to the APSR using APSR with the MSR instruction.

The PSR combinations and attributes are:

Table 26-3. Core register set summary

| REGISTER | TYPE* | COMBINATION |
|----------|----------|----------------------|
| PSR | RW *, ** | APSR, EPSR, and IPSR |
| IEPSR | RO | EPSR and IPSR |
| IAPSR | RW, * | APSR and IPSR |
| EAPST | RW, ** | APSR and EPSR |

* The processor ignores writes to the IPSR bits.

** Reads of the EPSR bits return zero, and the processor ignores writes to the these bits

See the instruction descriptions MRS in chapter 26.3.7.6 on page 340 and MSR in chapter 26.3.7.7 on page 341 for more information about how to access the program status registers.

26.2.1.3.6. Application Program Status Register

The APSR contains the current state of the condition flags, from previous instruction executions. See the register summary in Table 26-2. Core register set summary on page 287 for its attributes. The bit assignments are:

Table 26-4. APSR bit assignments

| BIT | NAME | FUNCTION |
|------|-----------------|----------------------|
| 31 | N | Negative Flag |
| 30 | Z | Zero Flag |
| 29 | C | Carry or Borrow Flag |
| 28 | V | Overflow Flag |
| 27:0 | Reserved | Reserved |

See The condition flags in chapter 26.3.3.6.1 on page 314 for more information about the APSR negative, zero, carry or borrow, and overflow flags.

26.2.1.3.7. Interrupt Program Status Register

The IPSR contains the exception number of the current Interrupt Service Routine (ISR). See the register summary in Table 26-2. Core register set summary on page 287 for its attributes. The bit assignments are:

Table 26-5. IPSR bit assignments

| BIT | NAME | FUNCTION |
|------|-----------------|----------|
| 31:6 | Reserved | Reserved |

| BIT | NAME | FUNCTION |
|-----|-------------------------|---|
| 5:0 | Exception Number | This is the number of the current exception: 63-48: Reserved 47: IRQ31 . . . 16: IRQ0 15: SysTick 14: PendSV 13-12: Reserved 11: SVCALL 10-4: Reserved 3: HardFault 2: NMI 1: Reserved 0: Thread mode see Exception types in chapter 26.2.3.2 on page 298 |

26.2.1.3.8. Execution Program Status Register

The EPSR contains the Thumb state bit.

See the register summary in Table 26-2. Core register set summary on page 287 for ESPR attributes. The bit assignments are:

Table 26-6. EPSR bit assignments

| BIT | NAME | FUNCTION |
|-------|-----------------|-----------------|
| 31:25 | Reserved | Reserved |
| 24 | T | Thumb state bit |
| 23:0 | Reserved | Reserved |

Attempts by application software to read the EPSR directly using the `MRS` instruction always return zero. Attempts to write the EPSR using the `MSR` instruction are ignored. Fault handlers can examine the EPSR value in the stacked PSR to determine the cause of the fault. See Exception entry and return in chapter 26.2.3.6 on page 302. The following can clear the T bit to 0:

- instructions `BLX`, `BX` and `POP{PC}`
- restoration from the stacked xPSR value on an exception return
- bit[0] of the vector value on an exception entry.

Attempting to execute instructions when the T bit is 0 results in a HardFault or lockup.

See Lockup in chapter 26.2.4.1 on page 304 for more information.

26.2.1.3.9. Interruptible-restartable instructions

The interruptible-restartable instructions are `LDM` and `STM`, and the multiply instruction. When an interrupt occurs during the execution of one of these instructions, the processor abandons execution of the instruction.

After servicing the interrupt, the processor restarts execution of the instruction from the beginning.

Table 26-8. CONTROL register bit assignments

| BIT | NAME | FUNCTION |
|------|-----------------------------|--|
| 31:1 | Reserved | Reserved |
| 0 | Active Stack Pointer | Defines the current stack: 1: MSP is the current stack pointer 0: PSP is the current stack pointer In Handler mode this bit reads as zero and ignores writes. |
| 0 | Reserved | Reserved |

Handler mode always uses the MSP, so the processor ignores explicit writes to the active stack pointer bit of the CONTROL register when in Handler mode. The exception entry and return mechanisms update the CONTROL register.

In an OS environment, it is recommended that threads running in Thread mode use the process stack and the kernel and exception handlers use the main stack.

By default, Thread mode uses the MSP. To switch the stack pointer used in Thread mode to the PSP, use the MSR instruction to set the Active stack pointer bit to 1, see MSR in chapter 26.3.7.7 on page 341.

Note

When changing the stack pointer, software must use an ISB instruction immediately after the MSR instruction. This ensures that instructions after the ISB execute using the new stack pointer. See ISB in chapter 26.3.7.5 on page 339.

26.2.1.4. Exceptions and interrupts

The Cortex-M0 processor supports interrupts and system exceptions. The processor and the Nested Vectored Interrupt Controller (NVIC) prioritize and handle all exceptions. An interrupt or exception changes the normal flow of software control. The processor uses handler mode to handle all exceptions except for reset. See Exception entry in chapter 26.2.3.6.5 on page 303 and Exception return in chapter 26.2.3.6.6 on page 303 for more information.

The NVIC registers control interrupt handling. See Nested Vectored Interrupt Controller in chapter 26.4.2 on page 346 for more information.

26.2.1.5. Data Types

The processor:

- supports the following data types:
 - 32-bit words
 - 16-bit halfwords
 - 8-bit bytes
- manages all data memory accesses as little-endian. Instruction memory and Private Peripheral Bus (PPB) accesses are always little-endian. See Memory regions, types and attributes in chapter 26.2.2.1 on page 294 for more information.

26.2.1.6. *The Cortex Microcontroller Software Interface Standard*

ARM provides the Cortex Microcontroller Software Interface Standard (CMSIS) for programming Cortex-M0 microcontrollers. The CMSIS is an integrated part of the device driver library. For a Cortex-M0 microcontroller system, CMSIS defines:

- a common way to:
 - access peripheral registers
 - define exception vectors
- the names of:
 - the registers of the core peripherals
 - the core exception vectors
- a device-independent interface for RTOS kernels.

The CMSIS includes address definitions and data structures for the core peripherals in the Cortex-M0 processor. It also includes optional interfaces for middleware components comprising a TCP/IP stack and a Flash file system.

The CMSIS simplifies software development by enabling the reuse of template code, and the combination of CMSIS-compliant software components from various middleware vendors. Software vendors can expand the CMSIS to include their peripheral definitions and access functions for those peripherals.

This document includes the register names defined by the CMSIS, and gives short descriptions of the CMSIS functions that address the processor core and the core peripherals.

Note

This document uses the register short names defined by the CMSIS. In a few cases these differ from the architectural short names that might be used in other documents.

The following sections give more information about the CMSIS:

- Power management programming hints in chapter 26.2.5.5 on page 307
- Intrinsic functions in chapter 26.3.2 on page 309
- Accessing the Cortex-M0 NVIC registers using CMSIS in chapter 26.4.2.1 on page 347
- NVIC programming hints in chapter 26.4.2.8.1 on page 351

26.2.2. Memory model

This section describes the processor memory map and the behavior of memory accesses. The processor has a fixed memory map that provides up to 4GB of addressable memory. The memory map is:

Figure 26-6. Memory Map

| | | |
|------------------------|-------|--|
| Device | 511MB | 0xFFFFFFFF |
| Private peripheral bus | 1MB | 0xE0100000 0xE00FFFFF 0xE0000000 0xDFFFFFFF |
| External device | 1.0GB | |
| External RAM | 1.0GB | 0xA0000000 0x9FFFFFFF |
| Peripheral | 0.5GB | 0x60000000 0x5FFFFFFF |
| SRAM | 0.5GB | 0x40000000 0x3FFFFFFF |
| Code | 0.5GB | 0x20000000 0x1FFFFFFF |
| | | 0x00000000 |

The processor reserves regions of the Private peripheral bus (PPB) address range for core peripheral registers, see About the Cortex-M0 processor and core peripherals in chapter 26.1.2 on page 284

26.2.2.1. Memory regions, types and attributes

The memory map is split into regions. Each region has a defined memory type, and some regions have additional memory attributes. The memory type and attributes determine the behavior of accesses to the region.

The memory types are:

26.2.2.1.1. Normal

The processor can re-order transactions for efficiency, or perform speculative reads.

26.2.2.1.2. Device

The processor preserves transaction order relative to other transactions to Device or Strongly-ordered memory.

26.2.2.1.3. Strongly-ordered

The processor preserves transaction order relative to all other transactions.

The different ordering requirements for Device and Strongly-ordered memory mean that the memory system can buffer a write to Device memory, but must not buffer a write to Strongly-ordered memory.

The additional memory attributes include.

26.2.2.1.4. Execute Never (XN)

Means the processor prevents instruction accesses. A HardFault exception is generated on executing an instruction fetched from an XN region of memory.

26.2.2.2. Memory system ordering of memory accesses

For most memory accesses caused by explicit memory access instructions, the memory system does not guarantee that the order in which the accesses complete matches the program order of the instructions, providing any re-ordering does not affect the behavior of the instruction sequence. Normally, if correct program execution depends on two memory accesses completing in program order, software must insert a memory barrier instruction between the memory access instructions, see Software ordering of memory accesses in chapter 26.2.2.4 on page 296.

However, the memory system does guarantee some ordering of accesses to Device and Strongly-ordered memory. For two memory access instructions A1 and A2, if A1 occurs before A2 in program order, the ordering of the memory accesses caused by two instructions is:

Figure 26-7. Memory Ordering Restrictions

| A1 \ A2 | Normal access | Device access | | Strongly-ordered access |
|------------------------------|---------------|---------------|-----------|-------------------------|
| | | Non-shareable | Shareable | |
| Normal access | - | - | - | - |
| Device access, non-shareable | - | < | - | < |
| Device access, shareable | - | - | < | < |
| Strongly-ordered access | - | < | < | < |

Where:

- Means that the memory system does not guarantee the ordering of the accesses.
- < Means that accesses are observed in program order, that is, A1 is always observed before A2.

26.2.2.3. Behavior of memory accesses

The behavior of accesses to each region in the memory map is:

Table 26-9. Memory Access Behavior

| ADDRESS RANGE | MEMORY REGION | MEMORY TYPE | XN* | DESCRIPTION |
|---------------------------|-------------------------------|--------------------|-----|---|
| 0xFFFF FFFF – 0xE010 0000 | Device | Device | XN | Reserved |
| 0xE00F FFFF – 0xE000 0000 | Private Peripheral Bus | Strongly - ordered | XN | This region includes the NVIC, System timer, and System Control Block. Only word accesses can be used in this region. |
| 0xDFFF FFFF – 0xA000 0000 | External Device | Device | XN | External device memory |
| 0x9FFF FFFF – 0x6000 0000 | External RAM | Normal | - | Executable region for data |
| 0x5FFF FFFF – 0x4000 0000 | Peripheral | Device | XN | External device memory |
| 0x3FFF FFFF – 0x2000 0000 | SRAM | Normal | - | Executable region for data. You can also put code here |
| 0x1FFF FFFF - 0x0000 0000 | Code | Normal | - | Executable region for program code. You can also put data here |

* See Memory regions, types and attributes in chapter 26.2.2.1 on page 294 for more information.

The Code, SRAM, and external RAM regions can hold programs.

26.2.2.4. Software ordering of memory accesses

The order of instructions in the program flow does not always guarantee the order of the corresponding memory transactions. This is because:

- the processor can reorder some memory accesses to improve efficiency, providing this does not affect the behavior of the instruction sequence
- memory or devices in the memory map might have different wait states
- some memory accesses are buffered or speculative.

Memory system ordering of memory accesses in chapter 26.2.2.2 on page 295 describes the cases where the memory system guarantees the order of memory accesses. Otherwise, if the order of memory accesses is critical, software must include memory barrier instructions to force that ordering. The processor provides the following memory barrier instructions:

26.2.2.4.1. DMB

The Data Memory Barrier (DMB) instruction ensures that outstanding memory transactions complete before subsequent memory transactions. See DMB in chapter 26.3.7.3 on page 338.

26.2.2.4.2. DSB

The Data Synchronization Barrier (DSB) instruction ensures that outstanding memory transactions complete

before subsequent instructions execute. See `DSB` in chapter 26.3.7.4 on page 339.

26.2.2.4.3. ISB

The Instruction Synchronization Barrier (`ISB`) ensures that the effect of all completed memory transactions is recognizable by subsequent instructions. See `ISB` in chapter 26.3.7.5 on page 339.

The following are examples of using memory barrier instructions:

26.2.2.4.4. Vector table

If the program changes an entry in the vector table, and then enables the corresponding exception, use a `DMB` instruction between the operations. This ensures that if the exception is taken immediately after being enabled the processor uses the new exception vector.

26.2.2.4.5. Self-modifying code

If a program contains self-modifying code, use an `ISB` instruction immediately after the code modification in the program. This ensures subsequent instruction execution uses the updated program.

26.2.2.4.6. Memory map switching

If the system contains a memory map switching mechanism, use a `DSB` instruction after switching the memory map. This ensures subsequent instruction execution uses the updated memory map.

Memory accesses to Strongly-ordered memory, such as the System Control Block, do not require the use of `DMB` instructions.

26.2.2.5. Memory endianness

The processor views memory as a linear collection of bytes numbered in ascending order from zero. For example, bytes 0-3 hold the first stored word, and bytes 4-7 hold the second stored word. Little-endian format in chapter 26.2.2.5.1 on page 297 describes how words of data are stored in memory.

26.2.2.5.1. Little-endian format

In little-endian format, the processor stores the least significant byte (lsbyte) of a word at the lowest-numbered byte, and the most significant byte (msbyte) at the highest-numbered byte. For example:

Figure 26-8. Little Endian Format

26.2.3. Exception model

This section describes the exception model.

26.2.3.1. Exception states

Each exception is in one of the following states:

26.2.3.1.1. Inactive

The exception is not active and not pending.

26.2.3.1.2. Pending

The exception is waiting to be serviced by the processor.

An interrupt request from a peripheral or from software can change the state of the corresponding interrupt to pending.

26.2.3.1.3. Active

An exception that is being serviced by the processor but has not completed.

Note

An exception handler can interrupt the execution of another exception handler. In this case both exceptions are in the active state.

26.2.3.1.4. Active and pending

The exception is being serviced by the processor and there is a pending exception from the same source.

26.2.3.2. Exception types

The exception types are:

26.2.3.2.1. Reset

Reset is invoked on power up or a warm reset. The exception model treats reset as a special form of exception. When reset is asserted, the operation of the processor stops, potentially at any point in an instruction. When reset is deasserted, execution restarts from the address provided by the reset entry in the vector table. Execution restarts in Thread mode.

26.2.3.2.2. NMI

A NonMaskable Interrupt (NMI) can be signaled by a peripheral or triggered by software. This is the highest priority exception other than reset. It is permanently enabled and has a fixed priority of -2. NMIs cannot be:

- masked or prevented from activation by any other exception
- preempted by any exception other than Reset.

26.2.3.2.3. HardFault

A HardFault is an exception that occurs because of an error during normal or exception processing. HardFaults have a fixed priority of -1, meaning they have higher priority than any exception with configurable priority.

26.2.3.2.4. SVCall

A supervisor call (SVC) is an exception that is triggered by the SVC instruction. In an OS environment, applications can use SVC instructions to access OS kernel functions and device drivers.

26.2.3.2.5. PendSV

PendSV is an interrupt-driven request for system-level service. In an OS environment, use PendSV for context switching when no other exception is active.

26.2.3.2.6. SysTick

A SysTick exception is an exception the system timer generates when it reaches zero. Software can also generate a SysTick exception. In an OS environment, the processor can use this exception as system tick.

26.2.3.2.7. Interrupt (IRQ)

An interrupt, or IRQ, is an exception signaled by a peripheral, or generated by a software request. All interrupts are asynchronous to instruction execution. In the system, peripherals use interrupts to communicate with the processor

Table 26-10. Properties of the different exception types

| EXCEPTION NUMBER* | IRQ NUMBER* | EXCEPTION TYPE | PRIORITY | VECTOR ADDRESS** | ACTIVATION |
|-------------------|-------------|----------------|-----------------|------------------|--------------|
| 1 | - | Reset | -3, the highest | 0x0000 0004 | Asynchronous |
| 2 | -14 | NMI | -2 | 0x0000 0008 | Asynchronous |
| 3 | -13 | HardFault | -1 | 0x0000 000C | Synchronous |
| 4-10 | - | Reserved | - | - | - |
| 11 | -5 | SVCall | Configurable*** | 0x0000 002C | Synchronous |

| EXCEPTION NUMBER* | IRQ NUMBER* | EXCEPTION TYPE | PRIORITY | VECTOR ADDRESS** | ACTIVATION |
|-------------------|-------------|-----------------|-----------------|---------------------------|--------------|
| 12-13 | - | Reserved | - | - | - |
| 14 | -2 | PendSV | Configurable*** | 0x0000 0038 | Asynchronous |
| 15 | -1 | SysTick | Configurable*** | 0x0000 003C | Asynchronous |
| 16 and above | 0 and above | Interrupt (IRQ) | Configurable*** | 0x0000 0040 and above**** | Asynchronous |

*To simplify the software layer, the CMSIS only uses IRQ numbers and therefore uses negative values for exceptions other than interrupts. The IPSR returns the Exception number, see Interrupt Program Status Register in chapter 26.2.1.3.5 on page 288.

**See Vector table for more information.

***See Interrupt Priority Registers in chapter 26.4.2.6 on page 349.

****Increasing in steps of 4.

For an asynchronous exception, other than reset, the processor can execute additional instructions between when the exception is triggered and when the processor enters the exception handler.

Privileged software can disable the exceptions that Table 26-10. Properties of the different exception types on page 299 shows as having configurable priority, see Interrupt Clear-enable Register in chapter 26.4.2.3 on page 348.

For more information about HardFaults, see Fault handling in chapter 26.2.4 on page 304.

26.2.3.3. Exception handlers

The processor handles exceptions using:

26.2.3.3.1. Interrupt Service Routines (ISRs)

Interrupts IRQ0 to IRQ31 are the exceptions handled by ISRs.

26.2.3.3.2. Fault handler

HardFault is the only exception handled by the fault handler.

26.2.3.3.3. System handlers

NMI, PendSV, SVCall SysTick, and HardFault are all system exceptions handled by system handlers.

26.2.3.4. Vector table

The vector table contains the reset value of the stack pointer, and the start addresses, also called exception vectors, for all exception handlers. Figure 26-9. Vector Table on page 301 shows the order of the exception vectors in the vector table. The least-significant bit of each vector must be 1, indicating that the exception handler is written in Thumb code.

Figure 26-9. Vector Table

| Exception number | IRQ number | Vector | Offset |
|------------------|------------|--------------------|--------|
| 47 | 31 | IRQ31 | 0xBC |
| . | | . | . |
| . | | . | . |
| . | | . | . |
| 18 | 2 | IRQ2 | 0x48 |
| 17 | 1 | IRQ1 | 0x44 |
| 16 | 0 | IRQ0 | 0x40 |
| 15 | -1 | SysTick Reserved | 0x3C |
| 14 | -2 | PendSV | 0x38 |
| 13 | | Reserved | |
| 12 | | | |
| 11 | -5 | SVCall | 0x2C |
| 10 | | | |
| 9 | | | |
| 8 | | | |
| 7 | | Reserved | |
| 6 | | | |
| 5 | | | |
| 4 | | | |
| 3 | -13 | HardFault | 0x10 |
| 2 | -14 | NMI | 0x0C |
| 1 | | Reset | 0x08 |
| | | Initial SP value | 0x04 |
| | | | 0x00 |

The vector table is fixed at address 0x0000 0000.

26.2.3.5. Exception priorities

As Table 26-10. Properties of the different exception types on page 299 shows, all exceptions have an associated priority, with:

- a lower priority value indicating a higher priority
- configurable priorities for all exceptions except Reset, HardFault, and NMI.

If software does not configure any priorities, then all exceptions with a configurable priority have a priority of 0. For information about configuring exception priorities see

- System Handler Priority Registers in chapter 26.4.3.7 on page 357
- Interrupt Priority Registers in chapter 26.4.2.6 on page 349.

Note

Configurable priority values are in the range 0-192, in steps of 64. The Reset, HardFault, and NMI exceptions, with fixed negative priority values, always have higher priority than any other exception.

Assigning a higher priority value to IRQ[0] and a lower priority value to IRQ[1] means that IRQ[1] has higher priority than IRQ[0]. If both IRQ[1] and IRQ[0] are asserted, IRQ[1] is processed before IRQ[0].

If multiple pending exceptions have the same priority, the pending exception with the lowest exception number takes precedence. For example, if both IRQ[0] and IRQ[1] are pending and have the same priority, then IRQ[0] is processed before IRQ[1].

When the processor is executing an exception handler, the exception handler is preempted if a higher priority exception occurs. If an exception occurs with the same priority as the exception being handled, the handler is not preempted, irrespective of the exception number. However, the status of the new interrupt changes to pending.

26.2.3.6. Exception entry and return

Descriptions of exception handling use the following terms:

26.2.3.6.1. Preemption

When the processor is executing an exception handler, an exception can preempt the exception handler if its priority is higher than the priority of the exception being handled.

When one exception preempts another, the exceptions are called nested exceptions. See Exception entry in chapter 26.2.3.6.5 on page 303 for more information.

26.2.3.6.2. Return

This occurs when the exception handler is completed, and:

- there is no pending exception with sufficient priority to be serviced
- the completed exception handler was not handling a late-arriving exception.

The processor pops the stack and restores the processor state to the state it had before the interrupt occurred. See Exception return in chapter 26.2.3.6.6 on page 303 for more information.

26.2.3.6.3. Tail-chaining

This mechanism speeds up exception servicing. On completion of an exception handler, if there is a pending exception that meets the requirements for exception entry, the stack pop is skipped and control transfers to the new exception handler.

26.2.3.6.4. Late-arriving

This mechanism speeds up preemption. If a higher priority exception occurs during state saving for a previous exception, the processor switches to handle the higher priority exception and initiates the vector fetch for that exception. State saving is not affected by late arrival because the state saved would be the same for both exceptions. On return from the exception handler of the late-arriving exception, the normal tail-chaining rules apply.

26.2.3.6.5. Exception entry

Exception entry occurs when there is a pending exception with sufficient priority and either:

- the processor is in Thread mode
- the new exception is of higher priority than the exception being handled, in which case the new exception preempts the exception being handled.

When one exception preempts another, the exceptions are nested.

Sufficient priority means the exception has greater priority than any limit set by the mask register, see Exception mask register in chapter 26.2.1.3.10 on page 291. An exception with less priority than this is pending but is not handled by the processor.

When the processor takes an exception, unless the exception is a tail-chained or a late-arriving exception, the processor pushes information onto the current stack. This operation is referred to as stacking and the structure of eight data words is referred to as a stack frame. The stack frame contains the following information:

Figure 26-10. Exception Entry Stack Contents

Immediately after stacking, the stack pointer indicates the lowest address in the stack frame. The stack frame is aligned to a double-word address.

The stack frame includes the return address. This is the address of the next instruction in the interrupted program. This value is restored to the PC at exception return so that the interrupted program resumes.

The processor performs a vector fetch that reads the exception handler start address from the vector table. When stacking is complete, the processor starts executing the exception handler. At the same time, the processor writes an EXC_RETURN value to the LR. This indicates which stack pointer corresponds to the stack frame and what operation mode the processor was in before the entry occurred.

If no higher priority exception occurs during exception entry, the processor starts executing the exception handler and automatically changes the status of the corresponding pending interrupt to active.

If another higher priority exception occurs during exception entry, the processor starts executing the exception handler for this exception and does not change the pending status of the earlier exception. This is the late arrival case.

26.2.3.6.6. Exception return

Exception return occurs when the processor is in Handler mode and execution of one of the following instructions attempts to set the PC to an EXC_RETURN value:

- a `POP` instruction that loads the PC
- a `BX` instruction using any register.

The processor saves an `EXC_RETURN` value to the LR on exception entry. The exception mechanism relies on this value to detect when the processor has completed an exception handler. Bits[31:4] of an `EXC_RETURN` value are `0xFFFF FFFF`. When the processor loads a value matching this pattern to the PC it detects that the operation is not a normal branch operation and, instead, that the exception is complete. Therefore, it starts the exception return sequence. Bits[3:0] of the `EXC_RETURN` value indicate the required return stack and processor mode, as Table 26-11. Execution return behavior on page 304 shows.

Table 26-11. Execution return behavior

| EXEC_RETURN | DESCRIPTION |
|------------------|---|
| 0xFFFF FFF1 | Return to Handler mode. Exception return gets state from the main stack. Execution uses MSP after return. |
| 0xFFFF FFF9 | Return to Thread mode. Exception return gets state from MSP. Execution uses MSP after return. |
| 0xFFFF FFFD | Return to Thread mode. Exception return gets state from PSP. Execution uses PSP after return. |
| All other values | Reserved |

26.2.4. Fault handling

Faults are a subset of exceptions, see Exception model in chapter 26.2.3 on page 298. All faults result in the `HardFault` exception being taken or cause lockup if they occur in the `NMI` or `HardFault` handler. The faults are:

- execution of an `SVC` instruction at a priority equal or higher than `SVCall`
- execution of a `BKPT` instruction without a debugger attached
- a system-generated bus error on a load or store
- execution of an instruction from an `XN` memory address
- execution of an instruction from a location for which the system generates a bus fault
- a system-generated bus error on a vector fetch
- execution of an Undefined instruction
- execution of an instruction when not in Thumb-State as a result of the T-bit being previously cleared to 0
- • an attempted load or store to an unaligned address.

Note

Only Reset and `NMI` can preempt the fixed priority `HardFault` handler. A `HardFault` can preempt any exception other than Reset, `NMI`, or another hard fault.

26.2.4.1. Lockup

The processor enters a lockup state if a fault occurs when executing the `NMI` or `HardFault` handlers, or if the system generates a bus error when unstacking the `PSR` on an exception return using the `MSP`. When the

processor is in lockup state it does not execute any instructions. The processor remains in lockup state until one of the following occurs:

- it is reset
- a debugger halts it
- an NMI occurs and the current lockup is in the HardFault handler.
-

Note

If lockup state occurs in the NMI handler a subsequent NMI does not cause the processor to leave lockup state.

26.2.5. Power management

The Cortex-M0 processor sleep modes reduce power consumption:

- a sleep mode, that stops the processor clock
- a deep sleep mode, that stops the system clock and switches off the PLL and flash memory.

The SLEEPDEEP bit of the SCR selects which sleep mode is used, see System Control Register in chapter 26.4.3.5 on page 356.

This section describes the mechanisms for entering sleep mode, and the conditions for waking up from sleep mode.

26.2.5.1. Entering sleep mode

This section describes the mechanisms software can use to put the processor into sleep mode.

The system can generate spurious wakeup events, for example a debug operation wakes up the processor. Therefore software must be able to put the processor back into sleep mode after such an event. A program might have an idle loop to put the processor back in to sleep mode.

26.2.5.1.1. Wait for interrupt

The Wait For Interrupt instruction, WFI, causes immediate entry to sleep mode. When the processor executes a WFI instruction it stops executing instructions and enters sleep mode. See `WFI` in chapter 26.3.7.12 on page 345 for more information.

26.2.5.1.2. Wait for event

The Wait For Event instruction, WFE, causes entry to sleep mode conditional on the value of a one-bit event register. When the processor executes a WFE instruction, it checks the value of the event register:

0: The processor stops executing instructions and enters sleep mode

1: The processor sets the register to zero and continues executing instructions without entering sleep mode.

See `WFE` in chapter 26.3.7.11 on page 344 for more information.

If the event register is 1b, this indicates that the processor must not enter sleep mode on execution of a `WFE` instruction. Typically, this is because of the assertion of an external event, or because another processor in the system has executed a `SEV` instruction, see `SEV` in chapter 26.3.7.9 on page 342. Software cannot access this register directly.

26.2.5.1.3. Sleep-on-exit

If the `SLEEPONEXIT` bit of the `SCR` is set to 1, when the processor completes the execution of an exception handler and returns to Thread mode it immediately enters sleep mode. Use this mechanism in applications that only require the processor to run when an interrupt occurs.

26.2.5.2. Wakeup from sleep mode

The conditions for the processor to wakeup depend on the mechanism that caused it to enter sleep mode.

26.2.5.2.1. Wakeup from WFI or sleep-on-exit

Normally, the processor wakes up only when it detects an exception with sufficient priority to cause exception entry.

Some embedded systems might have to execute system restore tasks after the processor wakes up, and before it executes an interrupt handler. To achieve this set the `PRIMASK` bit to 1. If an interrupt arrives that is enabled and has a higher priority than current exception priority, the processor wakes up but does not execute the interrupt handler until the processor sets `PRIMASK` to zero. For more information about `PRIMASK`, see Exception mask register in chapter 26.2.1.3.10 on page 291.

26.2.5.2.2. Wakeup from WFE

The processor wakes up if:

- it detects an exception with sufficient priority to cause exception entry.
- it detects an external event signal, see The external event input in chapter 26.2.5.4 on page 307.
- in a multiprocessor system, another processor in the system executes a `SEV` instruction.

In addition, if the `SEVONPEND` bit in the `SCR` is set to 1, any new pending interrupt triggers an event and wakes up the processor, even if the interrupt is disabled or has insufficient priority to cause exception entry. For more information about the `SCR` see System Control Register in chapter 26.4.3.5 on page 356.

26.2.5.3. The Wakeup Interrupt Controller

The Wakeup Interrupt Controller (WIC) is a peripheral that can detect an interrupt and wake the processor from deep sleep mode. The WIC is enabled only when the `DEEPSLEEP` bit in the `SCR` is set to 1b, see System Control Register in chapter 26.4.3.5 on page 356.

The WIC is not programmable, and does not have any registers or user interface. It operates entirely from hardware signals.

When the WIC is enabled and the processor enters deep sleep mode, the power management unit in the system can power down most of the Cortex-M0 processor. This has the side effect of stopping the SysTick timer. When the WIC receives an interrupt, it takes a number of clock cycles to wakeup the processor and restore its state, before it can process the interrupt. This means interrupt latency is increased in deep sleep mode.

26.2.5.4. The external event input

The processor provides an external event input signal. This signal is not available on this device.

26.2.5.5. Power management programming hints

ISO/IEC C cannot directly generate the WFI, WFE, and SEV instructions. The CMSIS provides the following intrinsic functions for these instructions:

```
void __WFE(void) // Wait for Event
void __WFI(void) // Wait for Interrupt
void __SEV(void) // Send Event
```

26.3. The Cortex-M0 Instruction Set

This chapter is the reference material for the Cortex-M0 instruction set description in a User Guide. The following sections give general information:

- Instruction set summary in chapter 26.3.1 on page 307.
- Intrinsic functions in chapter 26.3.2 on page 309.
- About the instruction descriptions in chapter 26.3.3 on page 310.

Each of the following sections describes a functional group of Cortex-M0 instructions.

Together they describe all the instructions supported by the Cortex-M0 processor:

- Memory access instructions in chapter 26.3.4 on page 315.
- General data processing instructions in chapter 26.3.5 on page 322.
- Branch and control instructions in chapter 26.3.6 on page 334.
- Miscellaneous instructions in chapter 26.3.7 on page 336.

26.3.1. Instruction set summary

The processor implements a version of the Thumb instruction set. Table 26-12. Cortex-M0 instructions lists the supported instructions.

Note

In Table 26-12. Cortex-M0 instructions:

- angle brackets, <>, enclose alternative forms of the operand
- braces, {}, enclose optional operands and mnemonic parts
- the Operands column is not exhaustive.

For more information on the instructions and operands, see the instruction descriptions.

Table 26-12. Cortex-M0 instructions

| MNEMONIC | OPERANDS | BRIEF DESCRIPTION | FLAGS | CHAPTER, PAGE |
|----------|---------------------|--|------------|----------------------------|
| ADCS | {Rd,} Rn, Rm | Add with Carry | N, Z, C, V | Chapter 26.3.5.1, page 323 |

26.3.2. Intrinsic Functions

ISO/IEC C code cannot directly access some Cortex-M0 instructions. This section describes intrinsic functions that can generate these instructions, provided by the CMSIS and that might be provided by a C compiler. If a C compiler does not support an appropriate intrinsic function, you might have to use inline assembler to access the relevant instruction.

The CMSIS provides the following intrinsic functions to generate instructions that ISO/IEC C code cannot directly access:

Table 26-13. CMSIS intrinsic functions to generate some Cortex-M0 instructions

| INSTRUCTION | CMSIS INTRINSIC FUNCTION |
|----------------|--|
| CPSIE <i>i</i> | <code>void __enable_irq (void)</code> |
| CPSID <i>i</i> | <code>void __disable_irq (void)</code> |
| ISB | <code>void __ISB(void)</code> |
| DSB | <code>void __DSB(void)</code> |

| INSTRUCTION | CMSIS INTRINSIC FUNCTION |
|-------------|------------------------------------|
| DMB | void __DMB(void) |
| NOP | void __NOP(void) |
| REV | uint32_t REV(uint32_t int value) |
| REV16 | uint32_t REV16(uint32_t int value) |
| REVSH | uint32_t REVSH(uint32_t int value) |
| SEV | void __SEV(void) |
| WFE | void __WFE(void) |
| WFI | void __WFI(void) |

The CMSIS also provides a number of functions for accessing the special registers using MRS and MSR instructions:

Table 26-14. CMSIS intrinsic functions to access special registers

| SPECIAL REGISTER | ACCESS | CMSIS FUNCTION |
|------------------|--------|--|
| PRIMASK | Read | uint32_t __get_PRIMASK (void) |
| | Write | void __set_PRIMASK (uint32_t value) |
| CONTROL | Read | uint32_t __get_CONTROL (void) |
| | Write | void __set_CONTROL (uint32_t value) |
| MSP | Read | uint32_t __get_MSP (void) |
| | Write | void __set_MSP (uint32_t TopOfMainStack) |
| PSP | Read | uint32_t __get_PSP (void) |
| | Write | void __set_PSP (uint32_t TopOfMainStack) |

26.3.3. About the Instruction Descriptions

The following sections give more information about using the instructions:

- Operands in chapter 26.3.3.1 on page 310
- Restrictions when using PC or SP in chapter 26.3.3.2 on page 311
- Shift Operations in chapter 26.3.3.3 on page 311
- Address alignment in chapter 26.3.3.4 on page 313
- PC-relative expressions in chapter 26.3.3.5 on page 313
- Conditional execution in chapter 26.3.3.6 on page 314

26.3.3.1. Operands

An instruction operand can be an ARM register, a constant, or another instruction-specific parameter. Instructions act on the operands and often store the result in a destination register. When there is a destination register in the instruction, it is usually specified before the other operands.

26.3.3.2. Restrictions when using PC or SP

Many instructions are unable to use, or have restrictions on whether you can use, the Program Counter (PC) or Stack Pointer (SP) for the operands or destination register. See instruction descriptions for more information.

Note

When you update the PC with a `BX`, `BLX`, or `POP` instruction, bit[0] of any address must be 1 for correct execution. This is because this bit indicates the destination instruction set, and the Cortex-M0 processor only supports Thumb instructions. When a `BL` or `BLX` instruction writes the value of bit[0] into the LR it is automatically assigned the value 1.

26.3.3.3. Shift Operations

Register shift operations move the bits in a register left or right by a specified number of bits, the shift length. Register shift can be performed directly by the instructions `ASR`, `LSR`, `LSL`, and `ROR` and the result is written to a destination register.

The permitted shift lengths depend on the shift type and the instruction, see the individual instruction description. If the shift length is 0, no shift occurs. Register shift operations update the carry flag except when the specified shift length is 0. The following sub-sections describe the various shift operations and how they affect the carry flag. In these descriptions, *Rm* is the register containing the value to be shifted, and *n* is the shift length.

26.3.3.3.1. ASR

Arithmetic shift right by *n* bits moves the left-hand 32-*n* bits of the register *Rm*, to the right by *n* places, into the right-hand 32-*n* bits of the result, and it copies the original bit[31] of the register into the left-hand *n* bits of the result. See Figure 26-11. `ASR #3` on page 311.

You can use the `ASR` operation to divide the signed value in the register *Rm* by 2^n , with the result being rounded towards negative-infinity.

When the instruction is `ASRS` the carry flag is updated to the last bit shifted out, bit[*n*-1], of the register *Rm*.

Note

- If *n* is 32 or more, then all the bits in the result are set to the value of bit[31] of *Rm*.
- If *n* is 32 or more and the carry flag is updated, it is updated to the value of bit[31] of *Rm*.

Figure 26-11. ASR #3

26.3.3.3.2. LSR

Logical shift right by n bits moves the left-hand $32-n$ bits of the register Rm , to the right by n places, into the right-hand $32-n$ bits of the result, and it sets the left-hand n bits of the result to 0. See Figure 26-12. LSR #3 on page 312.

You can use the LSR operation to divide the value in the register Rm by 2^n , if the value is regarded as an unsigned integer.

When the instruction is LSRS, the carry flag is updated to the last bit shifted out, bit[$n-1$], of the register Rm .

Note

- If n is 32 or more, then all the bits in the result are cleared to 0.
- If n is 33 or more and the carry flag is updated, it is updated to 0.

Figure 26-12. LSR #3

26.3.3.3.3. LSL

Logical shift left by n bits moves the right-hand $32-n$ bits of the register Rm , to the left by n places, into the left-hand $32-n$ bits of the result, and it sets the right-hand n bits of the result to 0. See Figure 26-13. LSL #3 on page 313.

You can use the LSL operation to multiply the value in the register Rm by 2^n , if the value is regarded as an unsigned integer or a two's complement signed integer. Overflow can occur without warning.

When the instruction is LSLS the carry flag is updated to the last bit shifted out, bit[$32-n$], of the register Rm . These instructions do not affect the carry flag when used with LSL #0.

Note

- If n is 32 or more, then all the bits in the result are cleared to 0.
- If n is 33 or more and the carry flag is updated, it is updated to 0.

Figure 26-13. LSL #3

26.3.3.3.4. ROR

Rotate right by n bits moves the left-hand $32-n$ bits of the register Rm , to the right by n places, into the right-hand $32-n$ bits of the result, and it moves the right-hand n bits of the register into the left-hand n bits of the result. See Figure 26-14. ROR #3 on page 313.

When the instruction is `RORS` the carry flag is updated to the last bit rotation, $\text{bit}[n-1]$, of the register Rm .

Note

- If n is 32, then the value of the result is same as the value in Rm , and if the carry flag is updated, it is updated to $\text{bit}[31]$ of Rm .
- ROR with shift length, n , greater than 32 is the same as ROR with shift length $n-32$.

Figure 26-14. ROR #3

26.3.3.4. Address alignment

An aligned access is an operation where a word-aligned address is used for a word, or multiple word access, or where a halfword-aligned address is used for a halfword access. Byte accesses are always aligned.

There is no support for unaligned accesses on the Cortex-M0 processor. Any attempt to perform an unaligned memory access operation results in a HardFault exception.

26.3.3.5. PC-relative expressions

A PC-relative expression or label is a symbol that represents the address of an instruction or literal data. It is represented in the instruction as the PC value plus or minus a numeric offset. The assembler calculates the required offset from the label and the address of the current instruction. If the offset is too big, the assembler produces an error.

Note

- For most instructions, the value of the PC is the address of the current instruction plus 4 bytes.
- Your assembler might permit other syntaxes for PC-relative expressions, such as a label plus or minus a number, or an expression of the form *[PC, #imm]*.

26.3.3.6. Conditional execution

Most data processing instructions update the condition flags in the Application Program Status Register (APSR) according to the result of the operation, see Application Program Status Register in chapter 26.2.1.3.6 on page 289. Some instructions update all flags, and some only update a subset. If a flag is not updated, the original value is preserved. See the instruction descriptions for the flags they affect.

You can execute a conditional branch instruction, based on the condition flags set in another instruction, either:

- immediately after the instruction that updated the flags
- after any number of intervening instructions that have not updated the flags.

On the Cortex-M0 processor, conditional execution is available by using conditional branches.

This section describes:

- The condition flags in chapter 26.3.3.6.1 on page 314
- Condition code suffixes in chapter 26.3.3.6.2 on page 315

26.3.3.6.1. The condition flags

The APSR contains the following condition flags:

- N Set to 1 when the result of the operation was negative, cleared to 0 otherwise.
- Z Set to 1 when the result of the operation was zero, cleared to 0 otherwise.
- C Set to 1 when the operation resulted in a carry, cleared to 0 otherwise.
- V Set to 1 when the operation caused overflow, cleared to 0 otherwise.

For more information about the APSR see Program Status Register in chapter 26.2.1.3.5 on page 288

A carry occurs:

- if the result of an addition is greater than or equal to 2^{32}
- if the result of a subtraction is positive or zero
- as the result of a shift or rotate instruction.

Overflow occurs when the sign of the result, in bit[31], does not match the sign of the result had the operation been performed at infinite precision, for example:

- if adding two negative values results in a positive value
- if adding two positive values results in a negative value
- if subtracting a positive value from a negative value generates a positive value
- if subtracting a negative value from a positive value generates a negative value.

The Compare operations are identical to subtracting, for *CMP*, or adding, for *CMN*, except that the result is discarded. See the instruction descriptions for more information.

26.3.3.6.2. Condition code suffixes

Conditional branch is shown in syntax descriptions as *B{cond}*. A branch instruction with a condition code is only taken if the condition code flags in the APSR meet the specified condition, otherwise the branch instruction is ignored. Table 26-15. Condition code suffixes on page 315 shows the condition codes to use.

Table 26-15. Condition code suffixes on page 315 also shows the relationship between condition code suffixes and the N, Z, C, and V flags.

Table 26-15. Condition code suffixes

| SUFFIX | FLAGS | MEANING |
|----------|--------------------|---|
| EQ | Z = 1 | Equal, last flag setting result was zero |
| NE | Z = 0 | Not equal, last flag setting result was non-zero |
| CS or HS | C = 1 | Higher or same, unsigned |
| CC or LO | C = 0 | Lower, unsigned |
| MI | N = 1 | Negative |
| PL | N = 0 | Positive or zero |
| VS | V = 1 | Overflow |
| VC | V = 0 | No overflow |
| HI | C = 1 and Z = 0 | Higher, unsigned |
| LS | C = 0 or Z = 1 | Lower or same, unsigned |
| GE | N = V | Greater than or equal, signed |
| LT | N != V | Less than, signed |
| GT | Z = 0 and N = V | Greater than, signed |
| LE | Z = 1 and N != V | Less than or equal, signed |
| AL | Can have any value | Always. This is the default when no suffix is specified |

26.3.4. Memory access instructions

Table 26-16. Memory access instructions on page 315 shows the memory access instructions:

Table 26-16. Memory access instructions

| MNEMONIC | BRIEF DESCRIPTION | SEE |
|-----------|--|---|
| ADR | Generate PC-Relative Address | ADR in chapter 26.3.4.1 on page 316 |
| LDM | Load Multiple Registers | LDM and STM in chapter 26.3.4.5 on page 320 |
| LDR{type} | Load Register using Immediate Offset | LDR and STR, immediate offset in chapter 26.3.4.2 on page 317 |
| LDR{type} | Load Register Using Register Offset | LDR and STR, register offset in chapter 26.3.4.3 on page 318 |
| LDR | Load Register from PC-Relative Address | LDR, PC-relative in chapter 26.3.4.4 on page 319 |
| POP | Pop Registers From Stack | PUSH and POP in chapter 26.3.4.6 on page 321 |

| MNEMONIC | BRIEF DESCRIPTION | SEE |
|-----------|---------------------------------------|--|
| PUSH | Push Registers To Stack | PUSH and POP in chapter 26.3.4.6 on page 321 |
| STM | Store Multiple Registers | LDM and STM in chapter 26.3.4.5 on page 320 |
| STR{type} | Store Register Using Immediate Offset | LDR and STR in chapter 26.3.4.2 on page 317 |
| STR{type} | Store Register Using Register Offset | LDR and STR in chapter 26.3.4.3 on page 318 |

26.3.4.1. ADR

Generates a PC-relative address.

26.3.4.1.1. Syntax

ADR *Rd*, *label*

where:

Rd is the destination register.

Label is a PC-relative expression. See PC-relative expressions in chapter 26.3.3.5 on page 313.

26.3.4.1.2. Operation

ADR generates an address by adding an immediate value to the PC, and writes the result to the destination register.

ADR facilitates the generation of position-independent code, because the address is PC-relative.

If you use ADR to generate a target address for a BX or BLX instruction, you must ensure that bit[0] of the address you generate is set to 1 for correct execution.

26.3.4.1.3. Restrictions

In this instruction *Rd* must specify R0-R7. The data-value addressed must be word aligned and within 1020 bytes of the current PC.

26.3.4.1.4. Condition flags

This instruction does not change the flags.

26.3.4.1.5. Examples

```
ADR R1, TextMessage           ; Write address value of a location labeled as
                               ; TextMessage to R1
```

ADR R3, [PC, #996] ; Set R3 to value of PC + 996.

26.3.4.2. LDR and STR, immediate offset

Load and Store with immediate offset.

26.3.4.2.1. Syntax

LDR *Rt*, [<*Rn* | *SP*> {, #*imm*}]

LDR<B|H> *Rt*, [*Rn* {, #*imm*}]

STR *Rt*, [<*Rn* | *SP*>, {, #*imm*}]

STR<B|H> *Rt*, [*Rn* {, #*imm*}]

where:

Rt is the register to load or store.

Rn is the register on which the memory address is based.

imm is an offset from *Rn*. If *imm* is omitted, it is assumed to be zero.

26.3.4.2.2. Operation

LDR, LDRB and LDRH instructions load the register specified by *Rt* with either a word, byte or halfword data value from memory. Sizes less than word are zero extended to 32-bits before being written to the register specified by *Rt*.

STR, STRB and STRH instructions store the word, least-significant byte or lower halfword contained in the single register specified by *Rt* in to memory. The memory address to load from or store to is the sum of the value in the register specified by either *Rn* or *SP* and the immediate value *imm*.

26.3.4.2.3. Restrictions

In these instructions:

- *Rt* and *Rn* must only specify R0-R7.
- *imm* must be between:
 - 0 and 1020 and an integer multiple of four for LDR and STR using SP as the base register
 - 0 and 124 and an integer multiple of four for LDR and STR using R0-R7 as the base register
 - 0 and 62 and an integer multiple of two for LDRH and STRH
 - 0 and 31 for LDRB and STRB
- The computed address must be divisible by the number of bytes in the transaction, see Address alignment in chapter 26.3.3.4 on page 313.

26.3.4.2.4. Condition flags

These instructions do not change the flags.

26.3.4.2.5. Examples

```
LDR R4, [R7] ; Loads R4 from the address in R7.  
STR R2, [R0, #const-struct] ; const-struct is an expression evaluating  
; to a constant in the range 0-1020.
```

26.3.4.3. LDR and STR, register offset

Load and Store with register offset.

26.3.4.3.1. Syntax

```
LDR Rt, [Rn, Rm]  
LDR<B|H> Rt, [Rn, Rm]  
LDR<SB|SH> Rt, [Rn, Rm]  
STR Rt, [Rn, Rm]  
STR<B|H> Rt, [Rn, Rm]
```

where:

Rt is the register to load or store.
Rn is the register on which the memory address is based.
Rm is a register containing a value to be used as the offset.

26.3.4.3.2. Operation

LDR, LDRB, LDRH, LDRSB and LDRSH load the register specified by *Rt* with either a word, zero extended byte, zero extended halfword, sign extended byte or sign extended halfword value from memory.

STR, STRB and STRH store the word, least-significant byte or lower halfword contained in the single register specified by *Rt* into memory.

The memory address to load from or store to is the sum of the values in the registers specified by *Rn* and *Rm*.

26.3.4.3.3. Restrictions

In these instructions:

- *Rt*, *Rn*, and *Rm* must only specify R0-R7.

- the computed memory address must be divisible by the number of bytes in the load or store, see Address alignment in chapter 26.3.3.4 on page 313.

26.3.4.3.4. Condition flags

These instructions do not change the flags.

26.3.4.3.5. Examples

```
STR R0, [R5, R1]      ; Store value of R0 into an address equal to
                        ; sum of R5 and R1
LDRSH R1, [R2, R3]     ; Load a halfword from the memory address
                        ; specified by (R2 + R3), sign extend to 32-bits
                        ; and write to R1.
```

26.3.4.4. LDR, PC-relative

Load register (literal) from memory.

26.3.4.4.1. Syntax

```
LDR Rt, label
```

where:

Rt is the register to load.

label is a PC-relative expression. See PC-relative expressions in chapter 26.3.3.5 on page 313.

26.3.4.4.2. Operation

Loads the register specified by *Rt* from the word in memory specified by *label*.

26.3.4.4.3. Restrictions

In these instructions, *label* must be within 1020 bytes of the current PC and word aligned.

26.3.4.4.4. Condition flags

These instructions do not change the flags.

26.3.4.4.5. Examples

```
LDR R0, LookUpTable           ; Load R0 with a word of data from an address
                               ; labeled as LookUpTable.
LDR R3, [PC, #100]           ; Load R3 with memory word at (PC + 100).
```

26.3.4.5. LDM and STM

Load and Store Multiple registers.

26.3.4.5.1. Syntax

`LDM Rn{!}, reglist`

`STM Rn!, reglist`

where:

Rn is the register on which the memory addresses are based.

! writeback suffix.

reglist is a list of one or more registers to be loaded or stored, enclosed in braces.

It can contain register ranges. It must be comma separated if it contains more than one register or register range, see Examples in chapter 26.3.4.5.5 on page 321.

LDMIA and **LDMFD** are synonyms for **LDM**. **LDMIA** refers to the base register being Incremented After each access. **LDMFD** refers to its use for popping data from Full Descending stacks.

STMIA and **STMEA** are synonyms for **STM**. **STMIA** refers to the base register being Incremented After each access. **STMEA** refers to its use for pushing data onto Empty Ascending stacks.

26.3.4.5.2. Operation

LDM instructions load the registers in *reglist* with word values from memory addresses based on *Rn*.

STM instructions store the word values in the registers in *reglist* to memory addresses based on *Rn*.

The memory addresses used for the accesses are at 4-byte intervals ranging from the value in the register specified by *Rn* to the value in the register specified by $Rn + 4 * (n-1)$, where *n* is the number of registers in *reglist*. The accesses happens in order of increasing register numbers, with the lowest numbered register using the lowest memory address and the highest number register using the highest memory address. If the writeback suffix is specified, the value in the register specified by $Rn + 4 * n$ is written back to the register specified by *Rn*.

26.3.4.5.3. Restrictions

In these instructions:

- *reglist* and *Rn* are limited to R0-R7.
- the writeback suffix must always be used unless the instruction is an `LDM` where *reglist* also contains *Rn*, in which case the writeback suffix must not be used.
- the value in the register specified by *Rn* must be word aligned. See Address alignment in chapter 26.3.3.4 on page 313.
- for `STM`, if *Rn* appears in *reglist*, then it must be the first register in the list.

26.3.4.5.4. Condition flags

These instructions do not change the flags.

26.3.4.5.5. Examples

```
LDM R0, {R0, R3, R4}           ; LDMIA is a synonym for LDM
STMIA R1!, {R2-R4, R6}
```

26.3.4.5.6. Incorrect examples

```
STM R5!, {R4, R5, R6}          ; Value stored for R5 is unpredictable
LDM R2, {}                      ; There must be at least one register in the list
```

26.3.4.6. *PUSH and POP*

Push registers onto, and pop registers off a full-descending stack.

26.3.4.6.1. Syntax

`PUSH` *reglist*

`POP` *reglist*

where:

reglist is a non-empty list of registers, enclosed in braces. It can contain register ranges. It must be comma separated if it contains more than one register or register range.

26.3.4.6.2. Operation

`PUSH` stores registers on the stack, with the lowest numbered register using the lowest memory address and the

highest numbered register using the highest memory address.

`POP` loads registers from the stack, with the lowest numbered register using the lowest memory address and the highest numbered register using the highest memory address.

`PUSH` uses the value in the `SP` register minus four as the highest memory address, `POP` uses the value in the `SP` register as the lowest memory address, implementing a full-descending stack. On completion, `PUSH` updates the `SP` register to point to the location of the lowest store value, `POP` updates the `SP` register to point to the location above the highest location loaded.

If a `POP` instruction includes `PC` in its *reglist*, a branch to this location is performed when the `POP` instruction has completed. Bit[0] of the value read for the `PC` is used to update the APSR T-bit. This bit must be 1 to ensure correct operation.

26.3.4.6.3. Restrictions

In these instructions:

- *reglist* must use only R0-R7.
- The exception is LR for a `PUSH` and PC for a `POP`.

26.3.4.6.4. Condition flags

These instructions do not change the flags.

26.3.4.6.5. Examples

```

PUSH {R0,R4-R7}           ; Push R0,R4,R5,R6,R7 onto the stack
PUSH {R2,LR}               ; Push R2 and the link-register onto the stack
POP {R0,R6,PC}             ; Pop r0,r6 and PC from the stack, then branch to
                           ; the new PC.
  
```

26.3.5. General data processing instructions

Table 26-17. Data processing instructions on page 322 shows the data access instructions:

Table 26-17. Data processing instructions

| MNEMONIC | BRIEF DESCRIPTION | SEE |
|----------|------------------------|---|
| ADCS | Add with Carry | ADC, ADD, RSB, SBC, and SUB in chapter 26.3.5.1 on page 323 |
| ADD{S} | Add | ADC, ADD, RSB, SBC, and SUB in chapter 26.3.5.1 on page 323 |
| ANDS | Logical AND | AND, ORR, EOR, and BIC on page |
| ASRS | Arithmetic Shift Right | ASR, LSL, LSR, and ROR in chapter 26.3.5.3 on page 327 |

| MNEMONIC | BRIEF DESCRIPTION | SEE |
|----------|--|---|
| BICS | Bit Clear | AND, ORR, EOR, and BIC in chapter 26.3.5.2 on page 325 |
| CMN | Compare Negative | CMP and CMN in chapter 26.3.5.4 on page 328 |
| CMP | Compare | CMP and CMN in chapter 26.3.5.4 on page 328 |
| EORS | Exclusive OR | AND, ORR, EOR, and BIC in chapter 26.3.5.2 on page 325 |
| LSL | Logical Shift Left | ASR, LSL, LSR, and ROR in chapter 26.3.5.3 on page 327 |
| LSRS | Logical Shift Right | ASR, LSL, LSR, and ROR in chapter 26.3.5.3 on page 327 |
| MOV{S} | Move | MOV and MVN in chapter 26.3.5.5 on page 329 |

| MVNS | Move NOT | MOV and MVN in chapter 26.3.5.5 on page 329 |
| ORRS | Logical OR | AND, ORR, EOR, and BIC in chapter 26.3.5.2 on page 325 |
| REV | Reverse Byte Order In A Word | REV, REV16, and REVSH in chapter 26.3.5.7 on page 331 |
| REV16 | Reverse Byte Order In each Half Word | REV, REV16, and REVSH in chapter 26.3.5.7 on page 331 |
| REVSH | Reverse Byte Order In Bottom Half Word and Sign Extend | REV, REV16, and REVSH in chapter 26.3.5.7 on page 331 |
| RORS | Rotate Right | ASR, LSL, LSR, and ROR in chapter 26.3.5.3 on page 327 |
| RSBS | Reverse Subtract | ADC, ADD, RSB, SBC, and SUB in chapter 26.3.5.1 on page 323 |
| SBCS | Subtract with Carry | ADC, ADD, RSB, SBC, and SUB in chapter 26.3.5.1 on page 323 |
| SUBS | Subtract | ADC, ADD, RSB, SBC, and SUB in chapter 26.3.5.1 on page 323 |
| SXTB | Sign Extend A Byte | SXT and UXT in chapter 26.3.5.8 on page 332 |
| SXTH | Sign Extend a Halfword | SXT and UXT in chapter 26.3.5.8 on page 332 |
| UXTB | Zero Extend a Byte | SXT and UXT in chapter 26.3.5.8 on page 332 |
| UXTH | Zero Extend a Halfword | SXT and UXT in chapter 26.3.5.8 on page 332 |
| TST | Test | TST in chapter 26.3.5.9 on page 333 |

26.3.5.1. ADC, ADD, RSB, SBC, and SUB

Add with carry, Add, Reverse Subtract, Subtract with carry, and Subtract.

26.3.5.1.1. Syntax

ADCS {*Rd*, } *Rn*, *Rm*

ADD{S} {*Rd*,} *Rn*, <*Rm*|#*imm*>

RSBS {*Rd*,} *Rn*, *Rm*, #0

SBCS {*Rd*,} *Rn*, *Rm*

SUB{S} {*Rd*,} *Rn*, <*Rm*|#*imm*>

Where:

S causes an ADD or SUB instruction to update flags

Rd specifies the result register

Rn specifies the first source register

Rm specifies the second source register

imm specifies a constant immediate value.

When the optional *Rd* register specifier is omitted, it is assumed to take the same value as *Rn*, for example ADDS *R1*, *R2* is identical to ADDS *R1*, *R1*, *R2*.

26.3.5.1.2. Operation

The ADCS instruction adds the value in *Rn* to the value in *Rm*, adding a further one if the carry flag is set, places the result in the register specified by *Rd* and updates the N, Z, C, and V flags.

The ADD instruction adds the value in *Rn* to the value in *Rm* or an immediate value specified by *imm* and places the result in the register specified by *Rd*.

The ADDS instruction performs the same operation as ADD and also updates the N, Z, C and V flags.

The RSBS instruction subtracts the value in *Rn* from zero, producing the arithmetic negative of the value, and places the result in the register specified by *Rd* and updates the N, Z, C and V flags.

The SBCS instruction subtracts the value of *Rm* from the value in *Rn*, deducts a further one if the carry flag is set. It places the result in the register specified by *Rd* and updates the N, Z, C and V flags.

The SUB instruction subtracts the value in *Rm* or the immediate specified by *imm*. It places the result in the register specified by *Rd*.

The SUBS instruction performs the same operation as SUB and also updates the N, Z, C and V flags.

Use ADC and SBC to synthesize multiword arithmetic, see Examples in chapter 26.3.5.1.4 on page 325.

See also ADR in chapter 26.3.4.1 on page 316.

26.3.5.1.3. Restrictions

Table 26-18. ADC, ADD, RSB, SBC, and SUB operand restrictions on page 324 lists the legal combinations of register specifiers and immediate values that can be used with each instruction.

Table 26-18. ADC, ADD, RSB, SBC, and SUB operand restrictions

| INSTRUCTION | RD | Rn | Rm | imm | RESTRICTIONS |
|-------------|--------|----------|-------|--------|--|
| ADCS | R0-R7 | R0-R7 | R0-R7 | - | <i>Rd</i> and <i>Rn</i> must specify the same register |
| ADD | R0-R15 | R0-R15 | R0-PC | - | <i>Rd</i> and <i>Rn</i> must specify the same register <i>Rn</i> and <i>Rm</i> must not both specify PC |
| | R0-R7 | SP or PC | - | 0-1020 | Immediate value must be an integer multiple of four |
| | SP | SP | - | 0-508 | Immediate value must be an integer multiple of four |
| ADDS | R0-R7 | R0-R7 | - | 0-7 | - |
| | R0-R7 | R0-R7 | - | 0-255 | <i>Rd</i> and <i>Rn</i> must specify the same register |
| | R0-R7 | R0-R7 | R0-R7 | - | - |
| RSBS | R0-R7 | R0-R7 | - | - | - |
| SBCS | R0-R7 | R0-R7 | R0-R7 | - | <i>Rd</i> and <i>Rn</i> must specify the same register |
| SUB | SP | SP | - | 0-508 | Immediate value must be an integer multiple of four |
| SUBS | R0-R7 | R0-R7 | - | 0-7 | - |
| | R0-R7 | R0-R7 | - | 0-255 | <i>Rd</i> and <i>Rn</i> must specify the same register |
| | R0-R7 | R0-R7 | R0-R7 | - | - |

26.3.5.1.4. Examples

Example below shows two instructions that add a 64-bit integer contained in R0 and R1 to another 64-bit integer contained in R2 and R3, and place the result in R0 and R1.

```
ADDS R0, R0, R2      ; add the least significant words
ADCS R1, R1, R3      ; add the most significant words with carry
```

Multiword values do not have to use consecutive registers. Example below shows instructions that subtract a 96-bit integer contained in R1, R2, and R3 from another contained in R4, R5, and R6. The example stores the result in R4, R5, and R6.

```
SUBS R4, R4, R1      ; subtract the least significant words
SBCS R5, R5, R2      ; subtract the middle words with carry
SBCS R6, R6, R3      ; subtract the most significant words with carry
```

Example below the RSBS instruction used to perform a 1's complement of a single register.

```
RSBS R7, R7, #0      ; subtract R7 from zero
```

26.3.5.2. AND, ORR, EOR, and BIC

Logical AND, OR, Exclusive OR, and Bit Clear.

26.3.5.2.1. Syntax

ANDS {*Rd*, } *Rn*, *Rm*

ORRS {*Rd*, } *Rn*, *Rm*

EORS {*Rd*, } *Rn*, *Rm*

BICS {*Rd*, } *Rn*, *Rm*

where:

Rd is the destination register.

Rn is the register holding the first operand and is the same as the destination register.

Rm second register.

26.3.5.2.2. Operation

The AND, EOR, and ORR instructions perform bitwise AND, exclusive OR, and inclusive OR operations on the values in *Rn* and *Rm*.

The BIC instruction performs an AND operation on the bits in *Rn* with the logical negation of the corresponding bits in the value of *Rm*.

The condition code flags are updated on the result of the operation, see Condition flags in chapter 26.3.4.6.4 on page 322.

26.3.5.2.3. Restrictions

In these instructions, *Rd*, *Rn*, and *Rm* must only specify R0-R7.

26.3.5.2.4. Condition flags

These instructions:

- update the N and Z flags according to the result
- do not affect the C or V flag.

26.3.5.2.5. Examples

ANDS R2, R2, R1

ORRS R2, R2, R5

ANDS R5, R5, R8

EORS R7, R7, R6

BICS R0, R0, R1

26.3.5.3. ASR, LSL, LSR, and ROR

Arithmetic Shift Right, Logical Shift Left, Logical Shift Right, and Rotate Right.

26.3.5.3.1. Syntax

ASRS {*Rd*, } *Rm*, *Rs*

ASRS {*Rd*, } *Rm*, #*imm*

LSLS {*Rd*, } *Rm*, *Rs*

LSLS {*Rd*, } *Rm*, #*imm*

LSRS {*Rd*, } *Rm*, *Rs*

LSRS {*Rd*, } *Rm*, #*imm*

RORS {*Rd*, } *Rm*, *Rs*

where:

Rd is the destination register. If *Rd* is omitted, it is assumed to take the same value as *Rm*.

Rm is the register holding the value to be shifted.

Rs is the register holding the shift length to apply to the value in *Rm*.

imm is the shift length. The range of shift length depends on the instruction:

ASR shift length from 1 to 32

LSL shift length from 0 to 31

LSR shift length from 1 to 32.

Note

MOVS *Rd*, *Rm* is a pseudonym for LSLS *Rd*, *Rm*, #0.

26.3.5.3.2. Operation

ASR, LSL, LSR, and ROR perform an arithmetic-shift-left, logical-shift-left, logical-shift-right or a right-rotation of the bits in the register *Rm* by the number of places specified by the immediate *imm* or the value in the least-significant byte of the register specified by *Rs*.

For details on what result is generated by the different instructions, see Shift Operations in chapter 26.3.3.3 on page 311.

26.3.5.3.3. Restrictions

In these instructions, *Rd*, *Rm*, and *Rs* must only specify R0-R7. For non-immediate instructions, *Rd* and *Rm* must specify the same register.

26.3.5.3.4. Condition flags

These instructions update the N and Z flags according to the result.

The C flag is updated to the last bit shifted out, except when the shift length is 0, see Shift Operations in chapter 26.3.3.3 on page 311. The V flag is left unmodified.

26.3.5.3.5. Examples

```
ASRS R7, R5, #9      ; Arithmetic shift right by 9 bits
LSLS R1, R2, #3      ; Logical shift left by 3 bits with flag update
LSRS R4, R5, #6      ; Logical shift right by 6 bits
RORS R4, R4, R6      ; Rotate right by the value in the bottom byte of R6.
```

26.3.5.4. CMP and CMN

Compare and Compare Negative.

26.3.5.4.1. Syntax

CMN *Rn*, *Rm*

CMP *Rn*, #*imm*

CMP *Rn*, *Rm*

where:

Rn is the register holding the first operand.

Rm is the register to compare with.

imm is the immediate value to compare with.

26.3.5.4.2. Operation

These instructions compare the value in a register with either the value in another register or an immediate value. They update the condition flags on the result, but do not write the result to a register.

The CMP instruction subtracts either the value in the register specified by *Rm*, or the immediate *imm* from the value in *Rn* and updates the flags. This is the same as a SUBS instruction, except that the result is discarded.

The CMN instruction adds the value of *Rm* to the value in *Rn* and updates the flags. This is the same as an ADDS

instruction, except that the result is discarded.

26.3.5.4.3. Restrictions

For the:

- CMN instruction *Rn*, and *Rm* must only specify R0-R7.
- CMP instruction:
 - *Rn* and *Rm* can specify R0-R14
 - immediate must be in the range 0-255.

26.3.5.4.4. Condition flags

These instructions update the N, Z, C and V flags according to the result

26.3.5.4.5. Examples

CMP R2, R9

CMN R0, R2

26.3.5.5. MOV and MVN

Move and Move NOT.

26.3.5.5.1. Syntax

MOV{S} *Rd*, *Rm*

MOVS *Rd*, #*imm*

MVNS *Rd*, *Rm*

where:

S is an optional suffix. If *S* is specified, the condition code flags are updated on the result of the operation, see Conditional execution in chapter 26.3.3.6 on page 314.

Rd is the destination register.

Rm is a register.

imm is any value in the range 0-255.

26.3.5.5.2. Operation

The `MOV` instruction copies the value of *Rm* into *Rd*.

The `MOVS` instruction performs the same operation as the `MOV` instruction, but also updates the N and Z flags.

The `MVNS` instruction takes the value of *Rm*, performs a bitwise logical negate operation on the value, and places the result into *Rd*.

26.3.5.5.3. Restrictions

In these instructions, *Rd*, and *Rm* must only specify R0-R7.

When *Rd* is the PC in a `MOV` instruction:

- Bit[0] of the result is discarded.
- A branch occurs to the address created by forcing bit[0] of the result to 0. The T-bit remains unmodified.
-

Note

Though it is possible to use `MOV` as a branch instruction, ARM strongly recommends the use of a `BX` or `BLX` instruction to branch for software portability.

26.3.5.5.4. Condition flags

If S is specified, these instructions:

- update the N and Z flags according to the result
- do not affect the C or V flags.

26.3.5.5.5. Example

```
MOVS R0, #0x000B      ; Write value of 0x000B to R0, flags get updated
MOVS R1, #0x0          ; Write value of zero to R1, flags are updated
MOV R10, R12           ; Write value in R12 to R10, flags are not updated
MOVS R3, #23           ; Write value of 23 to R3
MOV R8, SP             ; Write value of stack pointer to R8
MVNS R2, R0            ; Write inverse of R0 to the R2 and update flags
```

26.3.5.6. MULS

Multiply using 32-bit operands, and producing a 32-bit result.

26.3.5.6.1. Syntax

`MULS Rd, Rn, Rm`

where:

Rd is the destination register.

Rn, Rm are registers holding the values to be multiplied.

26.3.5.6.2. Operation

The `MUL` instruction multiplies the values in the registers specified by *Rn* and *Rm*, and places the least significant 32 bits of the result in *Rd*. The condition code flags are updated on the result of the operation, see Conditional execution in chapter 26.3.3.6 on page 314.

The results of this instruction does not depend on whether the operands are signed or unsigned.

26.3.5.6.3. Restrictions

In this instruction:

- *Rd, Rn*, and *Rm* must only specify R0-R7
- *Rd* must be the same as *Rm*.

26.3.5.6.4. Condition flags

This instruction:

- updates the N and Z flags according to the result
- does not affect the C or V flags.

26.3.5.6.5. Examples

```
MULS R0, R2, R0 ; Multiply with flag update, R0 = R0 x R2
```

26.3.5.7. *REV, REV16, and REVSH*

Reverse bytes.

26.3.5.7.1. Syntax

`REV Rd, Rn`

`REV16 Rd, Rn`

REVSH *Rd, Rn*

where:

Rd is the destination register.

Rn is the source register.

26.3.5.7.2. Operation

Use these instructions to change endianness of data:

REV converts 32-bit big-endian data into little-endian data or 32-bit little-endian data into big-endian data.

REV16 converts two packed 16-bit big-endian data into little-endian data or two packed 16-bit little-endian data into big-endian data.

REVSH converts 16-bit signed big-endian data into 32-bit signed little-endian data or 16-bit signed little-endian data into 32-bit signed big-endian data.

26.3.5.7.3. Restrictions

In these instructions, *Rd*, and *Rn* must only specify R0-R7.

26.3.5.7.4. Condition flags

These instructions do not change the flags.

26.3.5.7.5. Examples

```
REV R3, R7           ; Reverse byte order of value in R7 and write it to R3
REV16 R0, R0          ; Reverse byte order of each 16-bit halfword in R0
REVSH R0, R5          ; Reverse signed halfword
```

26.3.5.8. SXT and UXT

Sign extend and Zero extend.

26.3.5.8.1. Syntax

SXTB *Rd, Rm*

SXTH *Rd, Rm*

UXTB *Rd, Rm*

UXTH *Rd*, *Rm*

where:

Rd is the destination register.

Rm is the register holding the value to be extended.

26.3.5.8.2. Operation

These instructions extract bits from the resulting value:

- SXTB extracts bits[7:0] and sign extends to 32 bits
- UXTB extracts bits[7:0] and zero extends to 32 bits
- SXTH extracts bits[15:0] and sign extends to 32 bits
- UXTH extracts bits[15:0] and zero extends to 32 bits.

26.3.5.8.3. Restrictions

In these instructions, *Rd* and *Rm* must only specify R0-R7.

26.3.5.8.4. Condition flags

These instructions do not affect the flags.

26.3.5.8.5. Examples

```
SXTH R4, R6           ; Obtain the lower halfword of the
                        ; value in R6 and then sign extend to
                        ; 32 bits and write the result to R4.
UXTB R3, R1            ; Extract lowest byte of the value in R10 and zero
                        ; extend it, and write the result to R3
```

26.3.5.9. TST

Test bits.

26.3.5.9.1. Syntax

TST *Rn*, *Rm*

where:

Rn is the register holding the first operand.
Rm the register to test against.

26.3.5.9.2. Operation

This instruction tests the value in a register against another register. It updates the condition flags based on the result, but does not write the result to a register.

The `TST` instruction performs a bitwise AND operation on the value in *Rn* and the value in *Rm*. This is the same as the `ANDS` instruction, except that it discards the result.

To test whether a bit of *Rn* is 0 or 1, use the `TST` instruction with a register that has that bit set to 1 and all other bits cleared to 0.

26.3.5.9.3. Restrictions

In these instructions, *Rn* and *Rm* must only specify R0-R7.

26.3.5.9.4. Condition flags

This instruction:

- updates the N and Z flags according to the result
- does not affect the C or V flags.

26.3.5.9.5. Examples

```
TST R0, R1           ; Perform bitwise AND of R0 value and R1 value,
                     ; condition code flags are updated but result is discarded
```

26.3.6. Branch and control instructions

Table 26-19. Branch and Control instructions on page 334 shows the branch and control instructions:

Table 26-19. Branch and Control instructions

| MNEMONIC | BRIEF DESCRIPTION | SEE |
|----------|---------------------------|--|
| B{CC} | Branch {conditionally} | B, BL, BX, and BLX in chapter 26.3.6.1 on page 335 |
| BL | Branch with Link | B, BL, BX, and BLX in chapter 26.3.6.1 on page 335 |
| BLX | Branch indirect with Link | B, BL, BX, and BLX in chapter 26.3.6.1 on page 335 |
| BX | Branch indirect | B, BL, BX, and BLX in chapter 26.3.6.1 on page 335 |

26.3.6.1. B, BL, BX, and BLX

Branch instructions.

26.3.6.1.1. Syntax

`B{cond} label`

`BL label`

`BX Rm`

`BLX Rm`

where:

cond is an optional condition code, see Conditional execution in chapter 26.3.3.6 on page 314.

label is a PC-relative expression. See PC-relative expressions in chapter 26.3.3.5 on page 313.

Rm is a register providing the address to branch to.

26.3.6.1.2. Operation

All these instructions cause a branch to the address indicated by label or contained in the register specified by *Rm*. In addition:

- The `BL` and `BLX` instructions write the address of the next instruction to LR, the link register R14.
- The `BX` and `BLX` instructions result in a HardFault exception if bit[0] of *Rm* is 0.

`BL` and `BLX` instructions also set bit[0] of the LR to 1. This ensures that the value is suitable for use by a subsequent `POP {PC}` or `BX` instruction to perform a successful return branch.

Table 26-20. Branch ranges on page 335 shows the ranges for the various branch instructions.

Table 26-20. Branch ranges

| INSTRUCTION | BRANCH RANGE |
|-------------|-------------------------|
| B label | -2KB to + 2KB |
| Bcond label | -256bytes to +254 bytes |
| BL label | -16MB to +16MB |
| BX Rm | Any value in register |
| BLX Rm | Any value in register |

26.3.6.1.3. Restrictions

In these instructions:

- Do not use SP or PC in the `BX` or `BLX` instruction.
- For `BX` and `BLX`, bit[0] of *Rm* must be 1 for correct execution. Bit[0] is used to update the EPSR T-bit

and is discarded from the target address.

•

Note

BCOND is the only conditional instruction on the Cortex-M0 processor.

Condition flags

These instructions do not change the flags.

Examples

```

B loopA                ; Branch to loopA
BL funC                ; Branch with link (Call) to function funC, return address
                        ; stored in LR
BX LR                 ; Return from function call
BLX R0                ; Branch with link and exchange (Call) to an address stored
                        ; in R0
BEQ labelD            ; Conditionally branch to labelD if last flag setting
                        ; instruction set the Z flag, else do not branch.

```

26.3.7. Miscellaneous instructions

Table 26-21. Miscellaneous instructions on page 336 shows the remaining Cortex-M0 instructions:

Table 26-21. Miscellaneous instructions

| MNEMONIC | BRIEF DESCRIPTION | SEE |
|----------|--|--------------------------------------|
| BKPT | Breakpoint | BKPT in chapter 26.3.7.1 on page 337 |
| CPSID | Change Processor State, Disable Interrupts | CPS in chapter 26.3.7.2 on page 337 |
| CPSIE | Change Processor State, Enable Interrupts | CPS in chapter 26.3.7.2 on page 337 |
| DMB | Data Memory Barrier | DMB in chapter 26.3.7.3 on page 338 |
| DSB | Data Synchronization Barrier | DSB in chapter 26.3.7.4 on page 339 |
| ISB | Instruction Synchronization Barrier | ISB in chapter 26.3.7.5 on page 339 |
| MRS | Move from special register to register | MRS in chapter 26.3.7.6 on page 340 |
| MSR | Move from register to special register | MSR in chapter 26.3.7.7 on page 341 |
| NOP | No operation | NOP in chapter 26.3.7.8 on page 342 |
| SEV | Send Event | SEV in chapter 26.3.7.9 on page 342 |
| SVC | Supervisor Call | SVC in chapter 26.3.7.10 on page 343 |
| WFE | Wait for Event | WFE in chapter 26.3.7.11 on page 344 |
| WFI | Wait for interrupt | WFI in chapter 26.3.7.12 on page 345 |

26.3.7.1. BKPT

Breakpoint.

26.3.7.1.1. Syntax

`BKPT #imm`

where:

imm is an integer in the range 0-255.

26.3.7.1.2. Operation

The `BKPT` instruction causes the processor to enter Debug state. Debug tools can use this to investigate system state when the instruction at a particular address is reached.

imm is ignored by the processor. If required, a debugger can use it to store additional information about the breakpoint.

The processor might also produce a HardFault or go in to lockup if a debugger is not attached when a `BKPT` instruction is executed. See Lockup in chapter 26.2.4.1 on page 304 for more information.

26.3.7.1.3. Restrictions

There are no restrictions.

26.3.7.1.4. Condition flags

This instruction does not change the flags.

26.3.7.1.5. Examples

```
BKPT #0 ; Breakpoint with immediate value set to 0x0.
```

26.3.7.2. CPS

Change Processor State.

26.3.7.2.1. Syntax

`CPSID i`

`CPSIE i`

26.3.7.2.2. Operation

CPS changes the PRIMASK special register values. CPSID causes interrupts to be disabled by setting PRIMASK. CPSIE cause interrupts to be enabled by clearing PRIMASK. See Exception mask register in chapter 26.2.1.3.10 on page 291 for more information about these registers.

26.3.7.2.3. Restrictions

There are no restrictions.

26.3.7.2.4. Condition flags

This instruction does not change the condition flags.

26.3.7.2.5. Examples

```
CPSID i           ; Disable all interrupts except NMI (set PRIMASK)
CPSIE i           ; Enable interrupts (clear PRIMASK)
```

26.3.7.3. DMB

Data Memory Barrier.

26.3.7.3.1. Syntax

DMB

26.3.7.3.2. Operation

DMB acts as a data memory barrier. It ensures that all explicit memory accesses that appear in program order before the DMB instruction are observed before any explicit memory accesses that appear in program order after the DMB instruction. DMB does not affect the ordering of instructions that do not access memory.

26.3.7.3.3. Restrictions

There are no restrictions.

26.3.7.3.4. Condition flags

This instruction does not change the flags.

26.3.7.3.5. Examples

DMB ; Data Memory Barrier

26.3.7.4. DSB

Data Synchronization Barrier.

26.3.7.4.1. Syntax

DSB

26.3.7.4.2. Operation

DSB acts as a special data synchronization memory barrier. Instructions that come after the DSB, in program order, do not execute until the DSB instruction completes. The DSB instruction completes when all explicit memory accesses before it complete.

26.3.7.4.3. Restrictions

There are no restrictions.

26.3.7.4.4. Condition flags

This instruction does not change the flags.

26.3.7.4.5. Examples

DSB ; Data Synchronisation Barrier

26.3.7.5. ISB

Instruction Synchronization Barrier.

26.3.7.5.1. Syntax

ISB

26.3.7.5.2. Operation

ISB acts as an instruction synchronization barrier. It flushes the pipeline of the processor, so that all instructions following the ISB are fetched from cache or memory again, after the ISB instruction has been completed.

26.3.7.5.3. Restrictions

There are no restrictions.

26.3.7.5.4. Condition flags

This instruction does not change the flags.

26.3.7.5.5. Examples

ISB ; Instruction Synchronisation Barrier

26.3.7.6. MRS

Move the contents of a special register to a general-purpose register.

26.3.7.6.1. Syntax

MRS *Rd*, *spec_reg*

where:

Rd is the general-purpose destination register.

spec_reg is one of the special-purpose registers: APSR, IPSR, EPSR, IEPSR, IAPSR, EAPSR, PSR, MSP, PSP, PRIMASK, or CONTROL.

26.3.7.6.2. Operation

MRS stores the contents of a special-purpose register to a general-purpose register. The MRS instruction can be combined with the MSR instruction to produce read-modify-write sequences, which are suitable for modifying a specific flag in the PSR.

See MSR in chapter 26.3.7.7 on page 341.

26.3.7.6.3. Restrictions

In this instruction, *Rd* must not be SP or PC.

26.3.7.6.4. Condition flags

This instruction does not change the flags.

26.3.7.6.5. Examples

```
MRS R0, PRIMASK ; Read PRIMASK value and write it to R0
```

26.3.7.7. MSR

Move the contents of a general-purpose register into the specified special register.

26.3.7.7.1. Syntax

```
MSR spec_reg, Rn
```

where:

Rn is the general-purpose source register.

spec_reg is the special-purpose destination register: APSR, IPSR, EPSR, IEPSR, IAPSR, EAPSR, PSR, MSP, PSP, PRIMASK, or CONTROL.

26.3.7.7.2. Operation

MSR updates one of the special registers with the value from the register specified by *Rn*.

See MRSon 26.3.7.6 on page 340.

26.3.7.7.3. Restrictions

In this instruction, *Rn* must not be SP and must not be PC.

26.3.7.7.4. Condition flags

This instruction updates the flags explicitly based on the value in *Rn*.

26.3.7.7.5. Examples

MSR CONTROL, R1 ; Read R1 value and write it to the CONTROL register

26.3.7.8. NOP

No Operation.

26.3.7.8.1. Syntax

NOP

26.3.7.8.2. Operation

NOP performs no operation and is not guaranteed to be time consuming. The processor might remove it from the pipeline before it reaches the execution stage. Use NOP for padding, for example to place the subsequent instructions on a 64-bit boundary.

26.3.7.8.3. Restrictions

There are no restrictions.

26.3.7.8.4. Condition flags

This instruction does not change the flags.

26.3.7.8.5. Examples

NOP ; No operation

26.3.7.9. SEV

Send Event.

26.3.7.9.1. Syntax

SEV

26.3.7.9.2. Operation

`SEV` causes an event to be signaled to all processors within a multiprocessor system. It also sets the local event register, see Power management in chapter 26.2.5 on page 305.

See also `WFE` in chapter 26.3.7.11 on page 344.

26.3.7.9.3. Restrictions

There are no restrictions.

26.3.7.9.4. Condition flags

This instruction does not change the flags.

26.3.7.9.5. Examples

```
SEV                                ; Send Event
```

26.3.7.10. SVC

Supervisor Call.

26.3.7.10.1. Syntax

```
SVC #imm
```

where:

imm is an integer in the range 0-255.

26.3.7.10.2. Operation

The `SVC` instruction causes the SVC exception.

imm is ignored by the processor. If required, it can be retrieved by the exception handler to determine what service is being requested.

26.3.7.10.3. Restrictions

There are no restrictions.

26.3.7.10.4. Condition flags

This instruction does not change the flags.

26.3.7.10.5. Examples

```
SVC #0x32          ; Supervisor Call (SVC handler can extract the immediate value  
                  ; by locating it via the stacked PC)
```

26.3.7.11. WFE

Wait For Event.

26.3.7.11.1. Syntax

WFE

26.3.7.11.2. Operation

If the event register is 0, WFE suspends execution until one of the following events occurs:

- an exception, unless masked by the exception mask registers or the current priority level
- an exception enters the Pending state, if SEVONPEND in the System Control Register is set
- a Debug Entry request, if debug is enabled
- an event signaled by a peripheral or another processor in a multiprocessor system using the SEV instruction.

If the event register is 1, WFE clears it to 0 and completes immediately.

For more information see Power management in chapter 26.2.5 on page 305.

Note

WFE is intended for power saving only. When writing software assume that WFE might behave as NOP.

26.3.7.11.3. Restrictions

There are no restrictions.

26.3.7.11.4. Condition flags

This instruction does not change the flags.

26.3.7.11.5. Examples

```
WFE                                ; Wait for event
```

26.3.7.12. WFI

Wait for Interrupt.

26.3.7.12.1. Syntax

```
WFI
```

26.3.7.12.2. Operation

WFI suspends execution until one of the following events occurs:

- an exception
- an interrupt becomes pending which would preempt if PRIMASK was clear
- a Debug Entry request, regardless of whether debug is enabled.
-

Note

WFI is intended for power saving only. When writing software assume that WFI might behave as a NOP operation.

26.3.7.12.3. Restrictions

There are no restrictions.

26.3.7.12.4. Condition flags

This instruction does not change the flags.

26.3.7.12.5. Examples

```
WFI                                ; Wait for interrupt
```

26.4. Cortex-M0 Peripherals

The following sections are the reference material for the ARM Cortex-M0 core peripherals descriptions in a User Guide:

- About the Cortex-M0 peripherals in chapter 26.4.1 on page 346
- Nested Vectored Interrupt Controller in chapter 26.4.2 on page 346
- System Control Block in chapter 26.4.3 on page 352
- System timer, SysTick in chapter 26.4.4 on page 359

26.4.1. About the Cortex-M0 peripherals

The address map of the Private peripheral bus (PPB) is:

Table 26-22. Core peripheral register regions

| ADDRESS | CORE PERIPHERAL | DESCRIPTION |
|---------------------------|--------------------------------------|--|
| 0xE000 E008 – 0xE000 E00F | System Control Block | Table 26-31. Summary of the SCB register on page 352 |
| 0xE000 E010 – 0xE000 E01F | System Timer | Table 26-40. System timer register summary on page 359 |
| 0xE000 E100 – 0xE000 E4EF | Nested Vectored Interrupt Controller | Table 26-23. NVIC register summary on page 346 |
| 0xE000 ED00 – 0xE000 ED3F | System Control Block | Table 26-31. Summary of the SCB register on page 352 |
| 0xE000 EF00 – 0xE000 EF03 | Nested Vectored Interrupt Controller | Table 26-23. NVIC register summary on page 346 |

In register descriptions, the register type is described as follows:

RW Read and write.

RO Read-only.

WO Write-only.

26.4.2. Nested Vectored Interrupt Controller

This section describes the Nested Vectored Interrupt Controller (NVIC) and the registers it uses. The NVIC supports:

- 1 to 32 interrupts.
- A programmable priority level of 0-192 in steps of 64 for each interrupt. A higher level corresponds to a lower priority, so level 0 is the highest interrupt priority.
- Level and pulse detection of interrupt signals.
- Interrupt tail-chaining.
- An external Non-maskable interrupt (NMI).

The processor automatically stacks its state on exception entry and unstacks this state on exception exit, with no instruction overhead. This provides low latency exception handling. The hardware implementation of the NVIC registers is:

Table 26-23. NVIC register summary

| ADDRESS | NAME | TYPE | RESET VALUE | DESCRIPTION |
|------------------------------|--------|------|-------------|--|
| 0xE000 E100 | ISER | RW | 0x0000 0000 | Interrupt Set-enable Register in chapter 26.4.2.2 on page 347 |
| 0xE000 E180 | ICER | RW | 0x0000 0000 | Interrupt Clear-enable Register in chapter 26.4.2.3 on page 348 |
| 0xE000 E200 | ISPR | RW | 0x0000 0000 | Interrupt Set-pending Register in chapter 26.4.2.4 on page 348 |
| 0xE000 E280 | ICPR | RW | 0x0000 0000 | Interrupt Clear-pending Register in chapter 26.4.2.5 on page 349 |
| 0xE000 E400 – 0xE000 E41C | IPR0-7 | RW | 0x0000 0000 | Interrupt Priority Registers in chapter 26.4.2.6 on page 349 |

26.4.2.1. Accessing the Cortex-M0 NVIC registers using CMSIS

CMSIS functions enable software portability between different Cortex-M profile processors.

To access the NVIC registers when using CMSIS, use the following functions:

Table 26-24. CMSIS access NVIC functions

| CMSIS FUNCTION | DESCRIPTION |
|---|--|
| <code>void NVIC_EnableIRQ(IRQn_Type IRQn) *</code> | Enables an interrupt or exception |
| <code>void NVIC_DisableIRQ(IRQn_Type IRQn) *</code> | Disables an interrupt or exception |
| <code>void NVIC_SetPendingIRQ(IRQn_Type IRQn) *</code> | Set the pending status of interrupt or exception to 1 |
| <code>void NVIC_ClearPendingIRQ(IRQn_Type IRQn) *</code> | Clears the pending status of interrupt or exception to 0 |
| <code>uint32_t NVIC_GetPendingIRQ(IRQn_Type IRQn) *</code> | Reads the pending status of interrupt or exception. This function returns non-zero value if the pending status is set to 1. |
| <code>void NVIC_SetPriority(IRQn_Type IRQn, uint32_t priority) *</code> | Sets the priority of an interrupt or exception with configurable priority level to 1 |
| <code>uint32_t NVIC_GetPriority(IRQn_Type IRQn) *</code> | Reads the priority of an interrupt or exception with configurable priority level. This function returns the current priority level |

* The input parameter IRQn is the IRQ number see Table 26-10. Properties of the different exception types on page 299 for more information

26.4.2.2. Interrupt Set-enable Register

The ISER enables interrupts, and shows which interrupts are enabled. See the register summary in Table 26-23. NVIC register summary on page 346 for the register attributes.

The bit assignments are:

Figure 26-15. ISER

Table 26-25. ISER bit assignments

| BIT | NAME | FUNCTION |
|------|---------------|---|
| 31:0 | SETENA | Interrupt set-enable bits. Write: 1: enable interrupt 0: no effect Read: 1: interrupt enabled 0: interrupt disabled |

If a pending interrupt is enabled, the NVIC activates the interrupt based on its priority.

If an interrupt is not enabled, asserting its interrupt signal changes the interrupt state to pending, but the NVIC never activates the interrupt, regardless of its priority.

26.4.2.3. Interrupt Clear-enable Register

The ICER disables interrupts, and show which interrupts are enabled. See the register summary in Table 26-23. NVIC register summary on page 346 for the register attributes.

The bit assignments are:

Figure 26-16. ICER

Table 26-26. ICER bit assignments

| BIT | NAME | FUNCTION |
|------|-----------------|--|
| 31:0 | CLEARENA | Interrupt clear-enable bits. Write: 1: disable interrupt 0: no effect Read: 1: interrupt enabled 0: interrupt disabled |

26.4.2.4. Interrupt Set-pending Register

The ISPR forces interrupts into the pending state, and shows which interrupts are pending. See the register summary in Table 26-23. NVIC register summary on page 346 for the register attributes.

The bit assignments are:

Figure 26-17. ISPR

Table 26-27. ISPR bit assignments

| BIT | NAME | FUNCTION |
|------|----------------|--|
| 31:0 | SETPEND | Interrupt set-pending bits. Write: 1: changes interrupt state to pending 0: no effect Read: 1: changes interrupt state to pending 0: interrupt not pending |

Note

Writing 1 to the ISPR bit corresponding to:

- an interrupt that is pending has no effect
- a disabled interrupt sets the state of that interrupt to pending.

26.4.2.5. Interrupt Clear-pending Register

The ICPR removes the pending state from interrupts, and shows which interrupts are pending. See the register summary in Table 26-23. NVIC register summary on page 346 for the register attributes. The bit assignments are:

Figure 26-18. ICPR

Table 26-28. ICPR bit assignments

| BIT | NAME | FUNCTION |
|------|----------------|--|
| 31:0 | CLRPEND | Interrupt clear-pending bits. Write: 1: removes pending state an interrupt 0: no effect Read: 1: interrupt is pending 0: interrupt not pending |

Note

Writing 1 to an ICPR bit does not affect the active state of the corresponding interrupt

26.4.2.6. Interrupt Priority Registers

The IPR0-IPR7 registers provide an 8-bit priority field for each interrupt. These registers are only word-accessible. See the register summary in Table 26-23. NVIC register summary on page 346 for their attributes. Each register holds four priority fields as shown:

Figure 26-19. IPR

Table 26-29. IPR bit assignments

| BIT | NAME | FUNCTION |
|-------|-------------------------|--|
| 31:24 | Priority, byte offset 3 | Each priority field holds a priority value, 0-192. The lower the value, the greater the priority of the corresponding interrupt. The processor implements only bits[7:6] of each field, bits [5:0] read as zero and ignore writes. This means writing 255 to a priority register saves value 192 to the register |
| 23:16 | Priority, byte offset 2 | |
| 15:8 | Priority, byte offset 1 | |
| 7:0 | Priority, byte offset 3 | |

See Accessing the Cortex-M0 NVIC registers using CMSIS in chapter 26.4.2.1 on page 347 for more information about the access to the interrupt priority array, which provides the software view of the interrupt priorities.

Find the IPR number and byte offset for interrupt M as follows:

- the corresponding IPR number, N, is given by $N = N \text{ DIV } 4$
- the byte offset of the required Priority field in this register is $M \text{ MOD } 4$, where:
 - byte offset 0 refers to register bits[7:0]
 - byte offset 1 refers to register bits[15:8]
 - byte offset 2 refers to register bits[23:16]
 - byte offset 3 refers to register bits[31:24]

26.4.2.7. Level-sensitive and pulse interrupts

The processor supports both level-sensitive and pulse interrupts. Pulse interrupts are also described as edge-triggered interrupts.

A level-sensitive interrupt is held asserted until the peripheral deasserts the interrupt signal. Typically this happens because the ISR accesses the peripheral, causing it to clear the interrupt request. A pulse interrupt is an interrupt signal sampled synchronously on the rising edge of the processor clock. To ensure the NVIC detects the interrupt, the peripheral must assert the interrupt signal for at least one clock cycle, during which the NVIC

detects the pulse and latches the interrupt.

When the processor enters the ISR, it automatically removes the pending state from the interrupt, see Hardware and software control of interrupts in chapter 26.4.2.7.1 on page 351. For a level-sensitive interrupt, if the signal is not deasserted before the processor returns from the ISR, the interrupt becomes pending again, and the processor must execute its ISR again. This means that the peripheral can hold the interrupt signal asserted until it no longer needs servicing.

26.4.2.7.1. Hardware and software control of interrupts

The Cortex-M0 latches all interrupts. A peripheral interrupt becomes pending for one of the following reasons:

- the NVIC detects that the interrupt signal is active and the corresponding interrupt is not active
- the NVIC detects a rising edge on the interrupt signal
- software writes to the corresponding interrupt set-pending register bit, see Interrupt Set-pending Register in chapter 26.4.2.4 on page 348

A pending interrupt remains pending until one of the following:

- The processor enters the ISR for the interrupt. This changes the state of the interrupt from pending to active. Then:
 - For a level-sensitive interrupt, when the processor returns from the ISR, the NVIC samples the interrupt signal. If the signal is asserted, the state of the interrupt changes to pending, which might cause the processor to immediately re-enter the ISR. Otherwise, the state of the interrupt changes to inactive.
 - For a pulse interrupt, the NVIC continues to monitor the interrupt signal, and if this is pulsed the state of the interrupt changes to pending and active. In this case, when the processor returns from the ISR the state of the interrupt changes to pending, which might cause the processor to immediately re-enter the ISR. If the interrupt signal is not pulsed while the processor is in the ISR, when the processor returns from the ISR the state of the interrupt changes to inactive.
- Software writes to the corresponding interrupt clear-pending register bit. For a level-sensitive interrupt, if the interrupt signal is still asserted, the state of the interrupt does not change. Otherwise, the state of the interrupt changes to inactive. For a pulse interrupt, state of the interrupt changes to:
 - inactive, if the state was pending
 - active, if the state was active and pending.

26.4.2.8. NVIC usage hints and tips

Ensure software uses correctly aligned register accesses. The processor does not support unaligned accesses to NVIC registers.

An interrupt can enter pending state even if it is disabled. Disabling an interrupt only prevents the processor from taking that interrupt.

26.4.2.8.1. NVIC programming hints

Software uses the CPSIE i and CPSID i instructions to enable and disable interrupts. The CMSIS provides the

following intrinsic functions for these instructions:

```
void __disable_irq(void) // Disable Interrupts
```

```
void __enable_irq(void) // Enable Interrupts
```

In addition, the CMSIS provides a number of functions for NVIC control, including:

Table 26-30. CMSIS access NVIC functions

| CMSIS FUNCTION | DESCRIPTION |
|--|------------------------------------|
| void NVIC_EnableIRQ(IRQn_Type IRQn) | Enable IRQn |
| void NVIC_DisableIRQ(IRQn_Type IRQn) | Disable IRQn |
| uint32_t NVIC_GetPendingIRQ(IRQn_Type IRQn) | Return true (1) if IRQn is pending |
| void NVIC_SetPendingIRQ(IRQn_Type IRQn) | Set IRQn pending |
| void NVIC_ClearPendingIRQ(IRQn_Type IRQn) | Clear IRQn pending state |
| void NVIC_SetPriority(IRQn_Type IRQn, uint32_t priority) | Set priority for IRQn |
| uint32_t NVIC_GetPriority(IRQn_Type IRQn) | Read priority of IRQn |
| void NVIC_SystemReset (void) | Reset the system |

The input parameter IRQn is the IRQ number, see Table 26-10. Properties of the different exception types on page 299 more information. For more information about these functions, see the CMSIS documentation.

26.4.3. System Control Block

The System Control Block (SCB) provides system implementation information, and system control. This includes configuration, control, and reporting of the system exceptions. The SCB registers are:

Table 26-31. Summary of the SCB register

| ADDRESS | NAME | TYPE | RESET VALUE | DESCRIPTION |
|-------------|-------|------|-------------|--|
| 0xE000 ED00 | CPUID | RO | 0x410C C200 | CPUID Register in chapter 26.4.3.2 on page 353 |
| 0xE000 ED04 | ICSR | RW* | 0x0000 0000 | Interrupt Control and State Register in chapter 26.4.3.3 on page 353 |
| 0xE00 ED0C | AIRCR | RW* | 0xFA05 0000 | Application Interrupt and Reset Control Register in chapter 26.4.3.4 on page 355 |
| 0xE000 ED10 | SCR | RW | 0x0000 0000 | System Control Register in chapter 26.4.3.5 on page 356 |
| 0xE000 ED14 | CCR | RW | 0x0000 0204 | Configuration and Control register in chapter 26.4.3.6 on page 357 |
| 0xE000 ED1C | SHPR2 | RW | 0x0000 0000 | System Handler Priority register in chapter 26.4.3.7 on page 357 |
| 0xE000 ED20 | SHPR3 | RW | 0x0000 0000 | System Handler Priority register in chapter 26.4.3.7 on page 357 |

* See the register description for more information

26.4.3.1. The CMSIS mapping of the Cortex-M0 SCB registers

To improve software efficiency, the CMSIS simplifies the SCB register presentation. In the CMSIS, the array SHP[1] corresponds to the registers SHPR2-SHPR3

26.4.3.2. CPUID Register

The CPUID register contains the processor part number, version, and implementation information. See the register summary in Table 26-32. CPUID register bit assignments on page 353 for its attributes. The bit assignments are:

Figure 26-20. CPUID

Table 26-32. CPUID register bit assignments

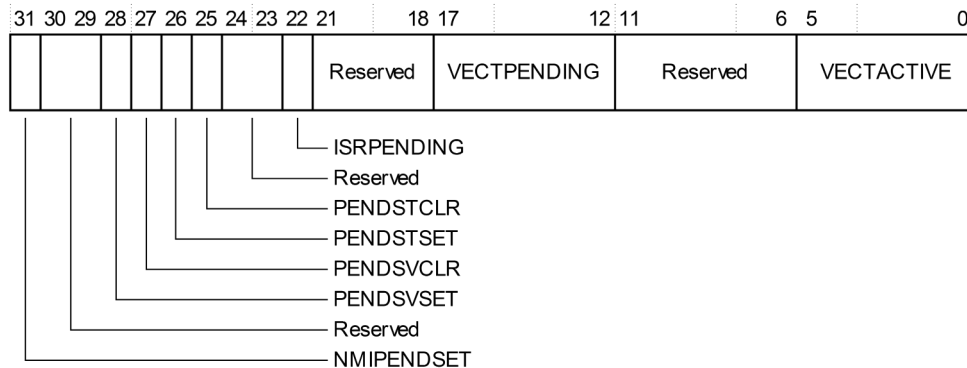

| BIT | NAME | FUNCTION |
|-------|--------------------|--|
| 31:24 | Implementer | Implementer code: 0x41 = ARM |
| 23:20 | Variant | Variant number, the r value in the rnpn product revision identifier: 0x0 = Revision 0 |
| 19:16 | Constant | Constant that defines the architecture of the processor:, reads as 0xC = ARMv6-M architecture |
| 15:4 | Partno | Part number of the processor: 0xC20 = Cortex-M0 |
| 3:0 | Revision | Revision number, the p value in the rnpn product revision identifier: 0x0 = Patch 0 |

26.4.3.3. Interrupt Control and State Register

The ICSR:

- provides:
 - a set-pending bit for the Non-Maskable Interrupt (NMI) exception
 - set-pending and clear-pending bits for the PendSV and SysTick exceptions
- indicates:
 - the exception number of the exception being processed
 - whether there are preempted active exceptions
 - the exception number of the highest priority pending exception
 - whether any interrupts are pending.

See the register summary in Table 26-33. ICSR register bit assignments on page 354 for the ICSR attributes. The bit assignments are:

Figure 26-21. ICSR

Table 26-33. ICSR register bit assignments

| BIT | NAME | TYPE | FUNCTION |
|-------|------------|------|--|
| 31 | NMIPENDSET | RW | NMI set-pending bit Write: 1: changes NMI exception state to pending 0: no effect Read: 1: NMI exception is pending 0: NMI exception is not pending Because NMI is the highest-priority exception, normally the processor enters the NMI exception handler as soon as it detects a write of 1 to this bit. Entering the handler then clears this bit to 0. This means a read of this bit by the NMI exception handler returns 1 only if the NMI signal is reasserted while the processor is executing that handler. |
| 30:29 | Reserved | RW | Reserved |
| 28 | PENDSVSET | RW | PendSV set-pending bit Write: 1: changes PendSV exception state to pending 0: no effect Read: 1: PendSV exception is pending 0: PendSV exception is not pending Writing 1 to this bit is the only way to set the PendSV state to pending |
| 27 | PENDSVCLR | WO | PendSV clear-pending bit Write: 1: removes the pending state from the PendSV exception 0: no effect |
| 26 | PENDSTSET | RW | SysTick exception set-pending bit. Write: 1: changes SysTick exception state to pending 0: no effect Read: 1: SysTick exception is pending 0: SysTick exception is not pending |
| 25 | PENDSTCLR | WO | SysTick exception clear-pending bit. Write: 1: removes the pending state from the SysTick exception This bit is WO. On a register read it's value is unknown |
| 24:23 | Reserved | RW | Reserved |
| 22 | ISRPENDING | RO | Interrupt pending flag, excluding NMI and Faults: 1: Interrupt pending 0: Interrupt not pending |

| BIT | NAME | TYPE | FUNCTION |
|-------|--------------------|------|--|
| 21:18 | Reserved | RW | Reserved |
| 17:12 | VECTPENDING | RO | Indicates the exception number of the highest priority pending enabled exception: Nonzero: the exception number of the highest priority pending enabled exception 0: no pending exceptions |
| 11:6 | Reserved | RW | Reserved |
| 5:0 | VECTACTIVE* | RO | Contains the active exception number: Nonzero: The exception number* of the currently active exception 0: Thread mode Note: Subtract 16 from this value to obtain the CMSIS IRQ number that identifies the corresponding bit in the Interrupt Clear-Enable, Set-Enable, Clear-Pending, Set-pending, and Priority Register, see Table 26-5. IPSR bit assignments on page 289 |

* This is the same value as IPSR bits[5:0], see Table 26-5. IPSR bit assignments on page 289

When you write to the ICSR, the effect is Unpredictable if you:

- write 1 to the PENDSVSET bit and write 1 to the PENDSVCLR bit
- write 1 to the PENDSTSET bit and write 1 to the PENDSTCLR bit.

26.4.3.4. Application Interrupt and Reset Control Register

The AIRCR provides endian status for data accesses and reset control of the system. See the register summary in Table 26-31. Summary of the SCB register on page 352 and Table 26-34. AIRCR register bit assignments on page 355 for its attributes.

To write to this register, you must write 0x05FA to the VECTKEY field, otherwise the processor ignores the write.

The bit assignments are:

Figure 26-22. AIRCR

Table 26-34. AIRCR register bit assignments

| BIT | NAME | TYPE | FUNCTION |
|-------|------------------|------|---|
| 31:16 | VECTKEY | RW | Register key Read: unknown Write: write 0x05FA to VECTKEY, otherwise the write is ignored |
| 15 | ENDIANESS | RO | Data endianess implemented 0x0: Little Endian |

| BIT | NAME | TYPE | FUNCTION |
|------|----------------------|------|--|
| 14:3 | Reserved | RW | Reserved |
| 2 | SYSRESETREQ | WO | System reset request: Read: This bit reads as 0. Write: 1: requests a system level reset. 0: no effect |
| 1 | VECTCLRACTIVE | WO | Reserved for debug use. This bit reads as 0. When writing to the register you must write 0 to this bit, otherwise behavior is Unpredictable. |
| 0 | Reserved | RW | Reserved |

26.4.3.5. System Control Register

The SCR controls features of entry to and exit from low power state. See the register summary in Table 26-35. SCR register bit assignments on page 356 for its attributes. The bit assignments are:

Figure 26-23. SCR

Table 26-35. SCR register bit assignments

| BIT | NAME | TYPE | FUNCTION |
|------|------------------|------|--|
| 31:5 | Reserved | R | Reserved |
| 4 | SEVONPEND | RW | Send Event on Pending bit: 1: enabled events and all interrupts, including disabled interrupts, can wakeup the processor 0: only enabled interrupts or events can wakeup the processor ,disabled interrupts are excluded When an event or interrupt enters pending state, the event signal wakes up the processor from WFE. If the processor is not waiting for an event ,the event is registered and affects the next WFE. The processor also wakes up on execution of an SEV instruction or external event |
| 3 | Reserved | R | Reserved |
| 2 | SLEEPDEEP | RW | Controls whether the processor uses sleep or deep sleep as its low power mode: 1: deep sleep 0: sleep |

| BIT | NAME | TYPE | FUNCTION |
|-----|--------------------|------|---|
| 1 | SLEEPONEXIT | RW | Indicates sleep-on-exit when returning from Handler mode to Thread mode: 1: enter sleep, or deep sleep, on return from an ISR to Thread mode. 0: do not sleep when returning to Thread mode. Setting this bit to 1 enables an interrupt driven application to avoid returning to an empty main application |
| 0 | Reserved | R | Reserved |

26.4.3.6. Configuration and Control Register

The CCR is a read-only register and indicates some aspects of the behavior of the Cortex-M0 processor. See the register summary in Table 26-36. CCR register bit assignments in page 357 for the CCR attributes. The bit assignments are:

Figure 26-24. CCR

Table 26-36. CCR register bit assignments

| BIT | NAME | TYPE | FUNCTION |
|-------|--------------------|------|---|
| 31:10 | Reserved | R | Reserved |
| 9 | STKALIGN | RW | Always reads as one, indicates 8-byte stack alignment on exception entry. On exception entry, the processor uses bit[9] of the stacked PSR to indicate the stack alignment. On return from the exception it uses this stacked bit to restore the correct stack alignment. |
| 8:4 | Reserved | R | Reserved |
| 3 | UNALIGN_TRP | RW | Always reads as one, indicates that all unaligned accesses generate a HardFault. |
| 0 | Reserved | R | Reserved |

26.4.3.7. System Handler Priority Registers

The SHPR2-SHPR3 registers set the priority level, 0 to 192, of the exception handlers that have configurable priority.

SHPR2-SHPR3 are word accessible. See the register summary in Table 26-31. Summary of the SCB register on page 352 for their attributes.

To access to the system exception priority level using CMSIS, use the following CMSIS functions:

- `uint32_t NVIC_GetPriority(IRQn_Type IRQn)`
- `void NVIC_SetPriority(IRQn_Type IRQn, uint32_t priority)`

The input parameter IRQn is the IRQ number, see Table 26-10. Properties of the different exception types on

page 299 for more information.

The system fault handlers, and the priority field and register for each handler are:

Table 26-37. System fault handler priority fields

| HANDLER | FIELD | REGISTER DESCRIPTION |
|---------|---------------|--|
| SVCall | PRI_11 | System handler Priority Register 2 on page |
| PendSV | PRI_14 | System Handler Priority register 3 on page |
| SysTick | PRI_15 | System Handler Priority register 3 on page |

Each PRI_N field is 8 bits wide, but the processor implements only bits[7:6] of each field, and bits[5:0] read as zero and ignore writes.

26.4.3.7.1. System Handler Priority Register 2

The bit assignments are:

Figure 26-25. SHPR2

Table 26-38. SHPR2 register bit assignments

| BIT | NAME | TYPE | FUNCTION |
|-------|-----------------|------|---------------------------------------|
| 31:24 | PRI_11 | RW | Priority of system Handler 11, SVCall |
| 23:0 | Reserved | R | Reserved |

26.4.3.7.2. System Handler Priority Register 3

The bit assignments are:

Figure 26-26. SHPR3

Table 26-39. SHPR3 register bit assignments

| BIT | NAME | TYPE | FUNCTION |
|-------|---------------|------|--|
| 31:24 | PRI_15 | RW | Priority of system Handler 15, SysTick exception |

| BIT | NAME | TYPE | FUNCTION |
|-------|-----------------|------|---------------------------------------|
| 23:16 | PRI_14 | RW | Priority of system Handler 14, PendSV |
| 15:0 | Reserved | R | Reserved |

26.4.3.8. SCB usage hints and tips

Ensure software uses aligned 32-bit word size transactions to access all the SCB registers.

26.4.4. System timer, SysTick

When enabled, the timer counts down from the reload value to zero, reloads (wraps to) the value in the SYST_RVR on the next clock cycle, then decrements on subsequent clock cycles. Writing a value of zero to the SYST_RVR disables the counter on the next wrap. When the counter transitions to zero, the COUNTFLAG status bit is set to 1. Reading SYST_CSR clears the COUNTFLAG bit to 0.

Writing to the SYST_CVR clears the register and the COUNTFLAG status bit to 0. The write does not trigger the SysTick exception logic. Reading the register returns its value at the time it is accessed.

Note

When the processor is halted for debugging the counter does not decrement. The system timer registers are:

Table 26-40. System timer register summary

| ADDRESS | NAME | TYPE | RESET VALUE | DESCRIPTION |
|-------------|------------|------|-------------|---|
| 0xE000 E010 | SYST_CSR | RW | 0x0000 0000 | Systick Control and Status Register in chapter 26.4.4.1 on page 359 |
| 0xE000 E014 | SYST_RVR | RW | Unknown | Systick Reload Value Register in chapter 26.4.4.2 on page 360 |
| 0xE000 E018 | SYST_CVR | RW | Unknown | Systick Current Register in chapter 26.4.4.3 on page 361 |
| 0xE000 E01C | SYST_CALIB | RO | 0x0000 0000 | Systick Calibration value Register in chapter 26.4.4.4 on page 361 |

26.4.4.1. SysTick Control and Status Register

The SYST_CSR enables the SysTick features. See the register summary in Table 26-41. SYST_CSR register bit assignments on page 360 for its attributes. The bit assignments are:

Figure 26-27. SYST_CSR

Table 26-41. SYST_CSR register bit assignments

| BITS | NAME | TYPE | FUNCTION |
|-------|------------------|------|---|
| 31:17 | Reserved | R | Reserved |
| 16 | COUNTFLAG | RW | Returns 1 if timer counted to 0 since the last read of this register |
| 15:3 | Reserved | R | Reserved |
| 2 | CLKSOURCE | RW | Selects the SysTick timer clock source 1: HCLK 0: FCLK / 3 |
| 1 | TICKINT | RW | Enables SysTick exception request 1: counting down to zero to assert the SysTick exception request 0: counting down to zero does not assert the SysTick exception request |
| 0 | ENABLE | RW | Enables the counter 1: counter enabled 0: counter disabled |

26.4.4.2. SysTick Reload Value Register

The SYST_RVR specifies the start value to load into the SYST_CVR. See the register summary in Table 26-42. SYST_RVR register bit assignments on page 360 for its attributes. The bit assignments are:

Figure 26-28. SYST_RVR

Table 26-42. SYST_RVR register bit assignments

| BITS | NAME | TYPE | FUNCTION |
|-------|-----------------|------|--|
| 31:24 | Reserved | R | Reserved |
| 23:0 | RELOAD | RW | Value to load into the SYST_CVR when the counter is enabled and when it reaches 0, see Calculating the RELOAD value. |

26.4.4.2.1. Calculating the RELOAD value

The RELOAD value can be any value in the range 0x000 00001 – 0x00FF FFFF. You can program a value of 0,

but this has no effect because the SysTick exception request and COUNTFLAG are activated when counting from 1 to 0.

To generate a multi-shot timer with a period of N processor clock cycles, use a RELOAD value of N-1. For example, if the SysTick interrupt is required every 100 clock pulses, set RELOAD to 99.

26.4.4.3. SysTick Current Value Register

The SYST_CVR contains the current value of the SysTick counter. See the register summary in Table 26-43. SYST_CVR register bit assignments on page 361 for its attributes. The bit assignments are:

Figure 26-29. SYST_CVR

Table 26-43. SYST_CVR register bit assignments

| BITS | NAME | TYPE | FUNCTION |
|-------|-----------------|------|---|
| 31:24 | Reserved | R | Reserved |
| 23:0 | CURRENT | RW | Reads return the current value of the SysTick counter. A write of any value clears the field to 0, and also clears the SYST_CSR.COUNTFLAG bit to 0. |

26.4.4.4. SysTick Calibration Value Register

The SYST_CALIB register indicates the SysTick calibration properties. See the register summary in Table 26-44. SYST_CALIB register bit assignments on page 361 for its attributes. The bit assignments are:

Figure 26-30. SYST_CALIB

Table 26-44. SYST_CALIB register bit assignments

| BITS | NAME | TYPE | FUNCTION |
|------|--------------|------|--|
| 31 | NOREF | R | Reads as one. Indicates no separate reference clock is provided |
| 30 | SKEW | R | Reads as one. Calibration value for the 10ms inexact timing is not known because TENMS is not known. This can affect the suitability of SysTick as a software real time clock. |

| BIT | NAME | TYPE | FUNCTION |
|-------|-----------------|------|---|
| 29:24 | Reserved | R | Reserved |
| 23:0 | TENMS | RW | Reads as zero. Indicates calibration value is not known |

If calibration information is not known, calculate the calibration value required from the frequency of the processor clock or external clock.

26.4.4.5. SysTick usage hints and tips

The interrupt controller clock updates the SysTick counter.

Ensure software uses word accesses to access the SysTick registers.

If the SysTick counter reload and current value are undefined at reset, the correct initialization sequence for the SysTick counter is:

1. Program reload value.
2. Clear current value.
3. Program Control and Status register.
